DECLARATION OF RICHARD LANG IN OPPOSITION TO SECOND MOTION FOR SUMMARY  
JUDGMENT OF INVALIDITY – Case No. C06-00019 MHP

1 I, Richard Lang, declare that:

2 1. I am the inventor of the claimed inventions in the '995, '932, '839 and '705 Patents  
3 in suit. I am currently the CEO of Burst.com, Inc. (Burst), the Defendant in the above-referenced  
4 Lawsuit. I have held various positions with Burst since its inception in 1987. When I refer to  
5 Burst, I am also referring to Explore Technology, Inc. and Instant Video Technologies, Inc., which  
6 are previous names used by Burst in its business. As a result of my affiliation with Burst, I have  
7 personal knowledge of its business.  
8

9 2. Soon after filing the '995 patent application in December 1988, Burst began to look  
10 for additional financial backing to commercialize the invention. One early investor was the  
11 financial arm of the band U2. U2 had become interested in new technologies that might eventually  
12 distribute its products electronically and found Burst's invention to be far ahead of the current state  
13 of the art and thus a worthy of high risk development investment. U2 invested \$2 million in Burst.  
14

15 3. Other investors in Burst over the years included several dozen various private  
16 investors who followed the company's progress over a period of approximately 15 years and  
17 invested in ongoing multiple financing rounds. Also, several private equity funds invested in Burst,  
18 including Storey Partners, Bay Star Ventures, Special Situations Fund, Millenium Capital Partners  
19 and Kellogg Capital Partners. Also, SBC Ventures, the investment arm of SBC Communications,  
20 invested \$5 million in Burst, in conjunction with the execution of an Operating Agreement with  
21 SBC Communications. These companies have invested tens of millions of dollars in Burst and its  
22 technology. At its peak, Burst had over 100 employees in 2000.  
23

24 4. In January 1991, Burst introduced its invention at the Consumer Electronics Show,  
25 the largest trade show for the consumer electronics industry, held each year in January in Las Vegas,  
26  
27

DECLARATION OF RICHARD LANG IN OPPOSITION TO SECOND MOTION FOR SUMMARY  
JUDGMENT OF INVALIDITY – Case No. C06-00019 MHP

1 Nevada. At the trade show, Burst demonstrated two prototypes embodying the company's  
2 invention. I was at the trade show and have personal knowledge of the events at the trade show.

3 5. As described in Burst's Opposition to Apple's Second Summary Judgment Motion,  
4 my invention includes the following:  
5

6 '932 Claim 4 is representative. It covers an "audio/video transceiver  
7 apparatus," meaning the components must be in a single housing, which is a  
8 feature of today's consumer electronics devices. Because "the steps of  
9 Burst's patents are necessarily sequential" (C.C. Ord. 24), the claimed  
10 components must be configured to allow each function to occur in a specific  
11 order. First, the "input" port receives large "full motion video programs."  
12 These programs or works must have a temporal dimension and artistic merit  
13 (as opposed to a text file that has no temporal quality or a voice mail that  
14 lacks creativity). Next, the "compression means" employs a compressor that  
15 reduces the number of bits of the video by performing specific compression  
16 algorithms designed for "efficient storage, transmission, and reception." '995  
17 2:46-51. Following compression, the time compressed video work is  
18 efficiently stored in "random access storage" (e.g., a magnetic disk),  
19 providing random access to any given segment of video. Such random access  
20 capability allows easy viewing and "provides convenience in the editing of  
21 stored data." '995 2:59-3:2. Finally, the random access allows the  
22 compressed video to be efficiently located and transmitted through an  
23 "output" port that sends the compressed video to an external device faster  
24 than it would take to play in real-time (i.e., FTRT transmission). In some of  
25 the claims (e.g., '995 Claim 17), the external device that receives the  
26 compressed work FTRT can store it in random access memory so that it can  
27 later be transmitted away FTRT again.

19 Representative '932 Claim 4, therefore, covers an integrated device that  
20 incorporates specialized components specifically configured to provide for  
21 the most efficient processing of a/v digital data, including receiving,  
22 compressing, decompressing, storing, viewing, editing, recording, and  
23 transmitting FTRT.

23 6. The prototypes shown at the 1991 CES embodied the above claim ('932 Claim 4),  
24 as well as other claims including: claims 1, 8, 17, and 19 of the '995 Patent; claims 1, 17, 19, 76,  
25 and 77 of the '839 Patent; and claims 12 and 21 of the '705 Patent.

26 7. Burst conducted live demonstrations of the prototypes at the 1991 CES. In general,  
27 to the best of my recollection, those demonstrations included the following functionality: receiving  
28

DECLARATION OF RICHARD LANG IN OPPOSITION TO SECOND MOTION FOR SUMMARY  
JUDGMENT OF INVALIDITY – Case No. C06-00019 MHP

1 (through a camera) audio/video at a first prototype, compressing the audio/video in the first  
2 prototype, storing the compressed audio/video in the first prototype, and then transmitting the  
3 compressed audio/video to a second prototype faster than real time. (Previously compressed  
4 audio/video stored in memory in the first prototype was also transmitted faster than real time to the  
5 second prototype.) The prototypes had a single housing, and the transmission occurred over a fiber  
6 optic line that connected the two prototypes. Once the content was received (faster than real time)  
7 at the second prototype, it then decompressed the audio/video and played it back in real time on a  
8 monitor.  
9

10 8. Burst's invention generated a lot of excitement at the trade show, and it was seen by  
11 many as heralding the future of true video-on-demand, whereby digital content could be sent faster  
12 than real time to consumers through a network. Following the trade show, Burst received more than  
13 1,500 inquiries about the prototypes, including at least seven from Apple employees who had seen  
14 the demonstration. The invention was also written up in many publications (*e.g.*, the *Philadelphia*  
15 *Inquirer*, *Christian Science Monitor*, *etc*) that were very complimentary.  
16

17 9. Burst's demonstration generated excitement because it represented a new direction  
18 for the audio/video content industry. At the time of invention, the industry standard for such  
19 content delivery was the real-time broadcast/streaming paradigm. This means that content was  
20 transmitted at the same rate at which the content would be played back.  
21

22 10. Starting in 1998, Burst began selling and licensing a software product called  
23 Burstware, which utilized faster-than-real-time delivery of audio/video content. Burstware worked  
24 in conjunction with some of the leading media players already on the market, including Microsoft's  
25 Windows Media Player and Apple's QuickTime, and solved many of the service problems inherent  
26 in conventional real-time streaming. In particular, Burstware's functionality included the faster-  
27

1 than-real-time transmission method that allowed smoother audio/video playback because content  
2 would be “burst” – i.e., transmitted faster than real time – through the network, and stored at the  
3 viewer’s (or listener’s) end, ahead of the time in which it would need to be played back. This  
4 means that momentary interruptions in the network wouldn’t interrupt the viewing (or listening) on  
5 the user’s end because the content would have already been sent through the network before the  
6 interruption, and would be viewed or listened to from the user’s storage. Burstware also allowed  
7 for content to be sent through the network and stored permanently on a consumer’s device for later  
8 playback. As described, the Burstware product solved real-time streaming problems including,  
9 among others, jittery pictures and black-out periods, which resulted from interruptions in the  
10 network service.  
11

12  
13 11. While Burst’s invention has been very important to the audio/video content industry  
14 and has driven the commercial success of many products that incorporate the technology, there were  
15 many skeptics along the way. Perhaps the most notable skeptic was Microsoft. Burst tried many  
16 times to convince Microsoft of the importance, and uses of, Burst’s technology. True and correct  
17 copies of emails between Burst and Microsoft managers and engineers (primarily Bill Shiefelbein  
18 and Will Friedman) showing this skepticism are attached hereto as Exhibits 1 and 2.  
19

20 12. After Microsoft received positive reports from Burst’s customers, including the  
21 major broadband internet services provider Excite@Home, Microsoft began to believe in the  
22 viability and advantages of the Burst faster than real time model for content delivery. A true and  
23 correct copy of an email from Microsoft employee Will Friedman to various Microsoft employees,  
24 discussing Burst and the conversation with Excite@Home, is attached hereto as Exhibit 3. This  
25 email was produced by Microsoft during prior litigation with Burst.  
26  
27

1           13.     Excite@Home conducted its own analysis of Burst's technology and found it  
2 superior in many ways to the conventional real-time streaming approach then in vogue, including  
3 offering the benefits of download and play. I believe that Apple is now using Burst's technology as  
4 Excite@Home had envisioned and has achieved remarkable commercial success doing so.  
5 Unfortunately, Excite@Home reorganized after testing Burst's product and failed to take advantage  
6 of the opportunity presented. A true and correct copy of an email from Excite@Home is attached  
7 hereto as Exhibit 4.  
8

9           14.     In late-2000, Burst hired Approach, Inc., an independent testing laboratory often  
10 used by Microsoft itself, to run a performance comparison between the ordinary Windows Media  
11 Player and the Burst-enabled Windows Media Player. Burst had hired Approach as a result of  
12 Microsoft's skepticism which I mentioned above. A true and correct copy of Approach's study is  
13 attached hereto as Exhibit 5. This study clearly showed that the Burst-enabled Windows Media  
14 Player was, among other things, "more scalable," "more efficient," and "able to deliver a higher-  
15 quality end-user experience than conventional [real time] streaming." Ex. 5, at APBU-00016782-  
16 83.  
17

18           15.     Burst has licensed the patents in suit. Six Burst patent licenses are attached hereto as  
19 Exhibits 6 - 11. Burst has also licensed its Burstware product, which allows for faster-than-real-  
20 time transmission among other things. Burst has granted more than 20 licenses for its Burstware  
21 product. An example of these product licenses is attached hereto as Exhibit 12.  
22

23           16.     In April, 2005, Microsoft paid \$60 million for a nonexclusive license to Burst's  
24 patents. This license was part of a settlement of litigation between Microsoft and Burst. A true and  
25 correct copy of this license agreement is attached hereto as Exhibit 11 (Filed under Seal). Burst had  
26 sued Microsoft over, among other things, Microsoft's distribution of its Windows Media Server and  
27

28 {00200589v1}

**DECLARATION OF RICHARD LANG IN OPPOSITION TO SECOND MOTION FOR SUMMARY  
JUDGMENT OF INVALIDITY – Case No. C06-00019 MHP**

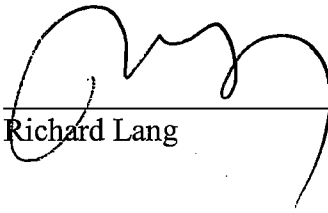

1 Player, which utilizes Burst's invention. This license was important to Microsoft because it  
2 allowed Microsoft to continue distributing its infringing product, and the license was important to  
3 Burst because it represented industry recognition for the importance of the technology embodied in  
4 Burst's patents.  
5

6 17. I was personally involved in many of the patent licenses and Burstware software  
7 licenses mentioned above. Based on my interaction with the licensees, it is my belief that the  
8 licensees took licenses because they recognized the benefits of Burst's patented technology that  
9 includes faster-than-real-time transmission and they wanted to take advantage of this technology.  
10

11 I declare under penalty of perjury under the laws of the United States of America that the  
12 foregoing is true and correct.

13 Executed this 28<sup>th</sup> day of August, 2007 at Santa Rosa, California

14  
15 Dated: August 28, 2007.
