## URL Redirects

Google Webmaster Tools scotttestflin.com [Change Account](#)

### Site Redirects

The Site Redirects Manager is your home base for creating, modifying, and deleting domain redirects.

A redirect automatically sends your website's visitors to a chosen destination, either a different location within the same site or a new site entirely. For example, you can redirect visitors from your domain root to a content subdirectory, such as a blog.

Content (files and folders) under the redirect path can be redirected to the destination domain root or the same path on the destination domain or not redirected at all.

Redirects can be permanent (a 301 redirect) or temporary (a 302 redirect). Redirect type is communicated to browsers and search engines through the redirecting site's HTTP response. Search engines treat 301 and 302 redirects differently.

No redirects have been created. [Create one now](#)
