***MARKMAN* ORDER**

I. INTRODUCTION

This is a patent infringement case, in which the Plaintiff, Acacia Media Technologies Corporation, ("Acacia") asserts that various internet based adult entertainment providers (collectively, "Defendants") infringe both U.S. Patent No. 5,132,992 (the '992 patent) and U.S. Patent No. 6,144,702 (the '702 patent) (collectively, the "patents-in-suit").

The Court conducted a hearing on four separate days in accordance with *Markman v. Westview Instruments, Inc.*, 517 U.S. 370 (1996), to construe the disputed terms and phrases of the asserted claims.[1] This Order gives the Court's construction of some of the disputed terms and phrases and invites further briefing or motions with respect to other terms.

II. Prosecution History of the '702 Patent and the '992 Patent

Both the '992 patent and the '702 patent, are members of the Yurt family of patents that includes five issued patents, all claiming a priority date of the '992 patent and sharing a common specification.[2] The '702 patent is a division of application Ser. No. 08/630,590, filed April 10, 1996, which issued as U.S. Pat. No. 6,002,720, which is a continuation of application Ser. No. 08/133,982, filed October 8, 1993, which issued as U.S. Pat. No. 5,550,863, which is a continuation of application Ser. No. 07/862,508, filed April 2, 1992, which issued as U.S. Pat. No. 5,253,275, which is a continuation application of Ser. No. 07/637,562, filed January 7, 1991, which issued as the '992 patent.

III. STANDARDS

The construction of the claims in a patent is a matter left to the province of the court. *Markman*, 517 U.S. at 391. A court's objective is to determine the plain meaning, if any, that those of ordinary skill in the art would apply to the language used in the patent claims. *Warner v. Ford Motor Co.*, 331 F.3d 851, 854 (Fed. Cir. 2003) (citing *Rexnord v. Laitram Corp*., 274 F.3d 1336, 1342 (Fed. Cir. 2001)). While the court may look to pertinent art dictionaries, treatises and encyclopedias for assistance, *Texas Digital Sys., Inc. v. Telegenix, Inc.*, 308 F.3d 1193, 1202-03 (Fed. Cir. 2002), the intrinsic record is the best source of the meaning of claim language. *Vitronics Corp. v. Conceptronics, Inc.*, 90 F.3d 1576, 1582 (Fed. Cir. 1996). Unless the inventor

---

[1] The Court conducted hearings in the Central District of California at the Santa Ana Federal Courthouse on February 6, 2004; April 9, 2004; May 18, 2004; and May 19, 2004.

[2] The Court notes that applicants did make corrections to the specification of the '702 patent, such as adding the phrase "[t]he receiving system recognizes copy protected programs and disables the audio-video recorder." *See* Miller Decl., Ex. GG ('702 prosecution history) at 211. Nothing in this Order shall be construed as endorsing any claimed priority dates of the patents-in-suit.

has manifested an express intent to depart from the ordinary and accustomed meaning that patent claim language has in the art, there is a heavy presumption that the inventor intended the ordinary meaning to apply. *See Teleflex Inc. v. Ficosa N. Am. Corp.*, 299 F.3d 1313, 1325 (Fed. Cir. 2002) (*en banc*) (citation omitted); *Bell Atlantic Network Servs., Inc. v. Covad Communications Group, Inc.*, 262 F.3d 1258, 1268 (Fed. Cir. 2001) (citation omitted). The use of extrinsic evidence in the claim construction process is "proper only when the claim language remains genuinely ambiguous after consideration of the intrinsic evidence." *Interactive Gift Express, Inc. v. Compuserve Incorp.*, 256 F.3d 1323, 1332 (Fed. Cir. 2001).

IV. DISCUSSION

A. Claim 1 of the '992 Patent

There are fifty-eight claims in the '992 patent, six of which are independent claims. The Court requested that the parties submit a list of disputed terms and phrases appearing in two independent claims: claim 1, an apparatus claim, and claim 41, a method claim. The Court explained that it would construe additional terms in the '992 patent at a later date, if requested by the parties.

With the disputed terms and phrases in bold, Claim 1 of the '992 patent recites:

> 1. A transmission system for providing information to be transmitted to **remote locations**, the transmission system comprising:
>
> **library means for storing items containing information**;
> **identification encoding means for retrieving the information in the items from the library means and for assigning a unique identification code to the retrieved information;**
>
> conversion means, coupled to the **identification encoding means**, for placing the retrieved information into a predetermined format as formatted data;
>
> **ordering means, coupled to the conversion means, for placing the formatted data into a sequence of addressable data blocks;**
>
> compression means, coupled to the ordering means, for compressing the formatted and sequenced data blocks;
>
> **compressed data storing means**, coupled to the data compression means, **for storing as files the compressed, sequenced data blocks received from the data compression means with the**

unique identification code assigned by the identification encoding means; and

transmitter means, coupled to the compressed data storing means, for sending at least a portion of one of the files to one of the **remote locations**.

('992 patent, 20:14-40) (emphasis added).

1. A transmission system for providing information to be transmitted to

"remote locations"

The parties request construction of the term "remote locations" that appears in claims 1, 19, 22, 25, 41, 47 and 54 of the '992 patent. Acacia contends that the term should have its ordinary and customary meaning, such that "remote locations" means "positions or sites distant in space from the position(s) or site(s) of the transmission system." To support its position, Acacia points to various parts of the claim language and the specification.

Defendants contend that the word "locations" simply is the plural of "location" and has a commonly understood meaning of more than one place or site. Defendants assert that the dispute centers upon the term "remote." Defendants contend that the term "remote locations" should be construed to mean "more than one location selected by the user."

The Court finds that the ordinary meaning of the term "remote locations" is "positions or sites distant in space from some identified place." In the context of claims 1 and 41, the ordinary meaning of the term is "positions or sites distant in space from the transmission system." In the context of claim 1 the term "remote locations" is described in relation to the transmission system in the preamble that recites "[a] transmission system for providing information to be transmitted to remote locations ..." Similarly, in claim 41 the "remote locations" are sites remote from the transmission system to which at least a portion of the file is sent.

Unlike other claims of the '992 patent that describe systems responsive to requests from a user (*e.g.,* claims 19 and 47), there is no such limitation included in independent claims 1 and 41. Specifically, claims 19 and 47 contain additional limitations that the remote location be specified by the user of the system. In other words, the term "remote locations" is used consistently by the

inventors in all claims but the inventors added additional words that limit the term to a remote location selected by the user in claims 19 and 47.

Defendants' proposed construction of "remote locations" would read the limitations of claims 19 and 47 into broader claims, a construction that would violate the doctrine of claim differentiation. "It is improper for a court to add 'extraneous' limitations to a claim, that is, limitations added 'wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim.'" *Hoganas AB v. Dresser Indus., Inc.*, 9 F.3d 949, 950 (Fed. Cir. 1993) (quoting *E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co.*, 849 F.2d 1430, 1433, (Fed. Cir.), *cert. denied*, 488 U.S. 986 (1988); *SRI Int'l v. Matsushita Elec. Corp. of Am.*, 775 F.2d 1107, 1122 (Fed. Cir. 1985) ("It is settled law that when a patent claim does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim in determining either validity or infringement.").

The Court looks to the specification to determine "whether the presumption of ordinary and customary meaning is rebutted." *Tex. Digital Sys.,* 308 F.3d at 1204; *see also Inverness Med. Switz. Gmbh v. Princeton Biomeditech Corp.*, 309 F.3d 1365, 1371-72 (Fed. Cir. 2002). The specification discloses a configuration that does not require a user to select a particular location. Figure 1g of the '992 patent shows a transmission system distributing to a receiving system, which preferably transmits requested material over airwave communication channels to a plurality of users. ('992 patent, 4:53-57). Also, the specification discloses "[t]he transmission system 100 of the present invention preferably further includes transmitter means 122, coupled to the compressed data library 118, for sending at least a portion of a specific file to at least one remote location." ('992 patent, 15:61-65).

Here, the specification does not overcome the heavy presumption that the plain and ordinary meaning should apply. *See CCS Fitness, Inc. v. Brunswick Corp.*, 288 F.3d 1359, 1366 (Fed. Cir. 2002)); *see also Mantech Envtl. Corp. v. Hudson Envtl. Servs., Inc.*, 152 F.3d 1368, 1374 (Fed. Cir. 1998) ("If the written description supports the definition of the term that is apparent from the claim limitation, then reading in a further limiting definition would be improper."); *Specialty Composites v. Cabot Corp.*, 845 F.2d 981, 987 (Fed. Cir. 1988) ("Where a

specification does not require a limitation, that limitation should not be read from the specification into the claims.").

Next, the Court considers statements made in the prosecution history of the '992 patent, as well as related patents that share the same specification, to determine whether the patentee effected a disclaimer of claim scope. *Microsoft Corp. v. Multi-Tech Sys., Inc.*, 357 F.3d 1340, 1349-50 (Fed. Cir. 2004). Such a disclaimer requires clear and unmistakable statements of disavowal. *See Cordis Corp. v. Medtronic AVE, Inc. at el*.,339 F.3d 1352, 1358 (Fed. Cir. 2003) (citing *Omega Eng'g, Inc. v. Raytek Corp.*, 334 F.3d 1314, 1325 (Fed. Cir. 2003)).

A "Petition to Make Special" allows an application to request an accelerated examination of an application. In exchange, the applicant must conduct a preexamination search and must provide "a detailed discussion of the references, which points out, ... how the claimed subject matter is distinguishable over the references." M.P.E.P. § 708.02. VIII (1989). In distinguishing the claimed invention from U.S. Patent No. 4,890,320 (hereinafter, "*Monslow*") that issued in 1989, the applicants explained that in *Monslow* "the viewer-chosen program is transmitted to the television receiver of the requesting viewer." (Miller Decl., Ex. B., p. 156). In distinguishing the claimed invention from U.S. Patent No. 4,506,387 (hereinafter, "*Walter*") that issued in 1985, the applicants explained that *Walter* "requires that the viewer be at the location for both ordering and viewing the audio/video material." *Id.* In distinguishing U.S. Patent No. 4,763,191 (hereinafter "*Gordon*") that issued in 1988, the applicants explained that *Gordon* did not disclose a provision for storage of requested programming before transmission to the user or for storage before the programming is played. *Id.*

The Court finds that there was no clear disavowment of claim scope during the prosecution history of the '992 patent that limits the plain and ordinary meaning of the term "remote locations." While the prior art references disclosed a system where the requesting device, either a telephone or a computer, is physically located at the same location as the receiving system, the applicants distinguished the present invention in that none of the references provided for the storing of the information at the receiving system location so that the information may be played back at a later time selected by the user. Thus, the requester of the

information may be physically located at a "remote location," because the prior art was overcome for more than one reason, creating no disavowment of claim scope.

Defendants contend that the applicants clearly disavowed and thereby limited the term "remote locations" by a statement made during the prosecution of the '720 patent application, a patent in Yurt family that issued in 1998. In the '720 patent application, the applicants amended a claim in response to an examiner's rejection. The applicants stated "to clarify remote location to which the information is transmitted is different from the accessing location at which the user is positioned when making the request." (Miller Decl., Ex. L, p. 502). The amendment and alleged disavowment were in response to the examiner's rejection of the claim as anticipated by U.S. Patent No. 5,195,092 (hereinafter, "*Wilson et al.*") that issued on March 16, 1993.

At the First *Markman* Hearing held on February 6, 2004, Defendants asserted that *Microsoft Corp. v. Multi-Tech Sys., Inc.* allowed a court to rely on comments made in subsequent related patent prosecutions to interpret disputed claims of previous issued patents. The Court disagrees. In *Microsoft*, the Federal Circuit stated that it was relying on comments directed at the common specification shared by both of the patents and was not relying on comments made regarding amendments to claims. *See Microsoft*, 357 F.3d at 1349 n5.

During claims construction of the '992 patent that issued in 1992, it would be improper for the Court to consider a comment made during prosecution of a related patent (the '720 patent) regarding an amendment to a claim made in 1998 to overcome 1993 prior art. *See id*; *Georgia-Pacific Corp. v. United States Gypsum Co.*, 195 F.3d 1322 (Fed. Cir. 1999).

Therefore, the Court finds "remote locations" to have its ordinary meaning "positions or sites distant in space from some identified place or places." In claims 1 and 41 of the '992 patent, the term "remote locations" means "positions or sites distant in space from the transmission system."

2. "library means for storing items containing information" (claim 1 of the '992 patent)

The parties request that the Court construe the phrase "library means for storing items containing information" that appears in claim 1 of the '992 patent.

Acacia contends that the phrase "library means for storing items having information" is not a means-plus-function limitation, because sufficient structure for performing the claimed function is disclosed in the claim. Acacia contends that sufficient structure is elaborated in claim 1 by including the term "library." Acacia supports its position through use of a dictionary that defines the term "library" as "a place where materials are kept or a collection of such materials." Also, Acacia relies on the specification stating that "the library has a geographical location and that multiple libraries in a system may communicate with one another. ('992 patent, 2:65-66; 6:23-30; and 15:13-15)." (Acacia's Claim Construction Brief, January 8, 2004).

Defendants contend that sufficient structure is not recited in the claim. Defendants contend that the claimed function of "storing items containing information" should be construed to require that the library means must have items containing information that may be readily accessed for use by the transmission system, *i.e.*, the library is part of the transmission system. Defendants contend that although a generic "library" is capable of retaining items at a particular location, a generic library does not make these items available for use by the claimed transmission system. Defendants assert that the only type of library that performs the claimed function is the "source material library" disclosed in the specification.

The use of the term "means for" in a claim limitation creates a rebuttable presumption that the limitation is drafted in § 112, ¶ 6 format. *NCR Corp. v. Palm, Inc.*, 217 F. Supp. 2d 491, 502 (D. Del. 2002) (citing *Kemco Sales, Inc. v. Control Papers, Co.*, 208 F.3d 1352, 1361 (Fed. Cir. 2000). One can rebut that presumption by showing that the claim itself recites sufficiently definite structure to perform the claimed function. *Id. See also Envirco Corp. v. Clestra Cleanroom, Inc.*, 209 F.3d 1360 (Fed. Cir. 1994);[3] *Unidynamics Corp. v. Automatic Prods. Int'l*

---

[3]In *Envirco Corp. v. Clestra Cleanroom, Inc.*, 209 F.3d 1360 (Fed. Cir. 1994), the claim at issue described a centrifugal fan and filter assembly for clean room environments. The district court had construed "second baffle means" as a means-plus-function element and had looked to the specification to determine its corresponding structure. The first embodiment described a baffle having continuous arcuate surfaces; the district court found that the claims required such arcuate structure. Since the accused product had baffles formed of L-shaped material, the district court granted summary judgment of non-infringement.

On appeal, the Federal Circuit reversed, noting that while the district court had properly

Ltd., 157 F.3d 1311, 1319 (Fed. Cir. 1998)[4]

The clause "library means for storing items having information" is written such that the means-plus-function presumption of § 112, ¶ 6 does apply. *See Greenberg v. Ethicon Endo Surgery, Inc.*, 91 F.3d 1580 (Fed. Cir. 1996) ("Claim drafters conventionally use the preface 'means for' (or 'step for') when they intend to invoke section 112(6), and there is therefore seldom any confusion about whether section 112(6) applies to a particular element."); *Sage Prods.*, 126 F.3d at 1427. "This presumption is overcome in two ways." *Allen Eng'g Corp. v. Bartell Indus., Inc.*, 299 F.3d 1336, 1347 (Fed. Cir. 2002).

> "First, a claim element that uses the word 'means' but recites no function corresponding to the means does not invoke § 112, ¶ 6." *Allen Eng'g Corp.*, 299 F.3d at 1347 (citations omitted).

In the case at hand, the presumption is not overcome by the first method because there is a function corresponding to the means recited in the claim: "library means **for storing items having information**." ('992 patent, 20:17) (emphasis added).

> "Second, even if the claim element specifies a function, if it also recites sufficient structure or material for performing that function, § 112, ¶ 6 does not apply." *Allen Eng'g Corp.*, 299 F.3d at 1347 (citations omitted).

Here, the issue is whether the term "library" is a sufficient recital of structure to perform the function.

---

performed the first part of the analysis, it had failed to perform the second part of the analysis, which is to determine whether the means clause cited sufficient structure to stand upon its own without invoking § 112, ¶ 6 to identify the claimed structure. The court concluded that the patentee had rebutted the presumption and thus the element was not subject to § 112, ¶ 6 .

[4]In contrast, the Federal Circuit construed "spring means tending to keep the door closed" to be means-plus-function in *Unidynamics Corp. v. Automatic Prods. Int'l Ltd.*, 157 F.3d 1311, 1319 (Fed. Cir. 1998). The Federal Circuit agreed with the lower court that the term "spring" is a structural term, but held that the remainder of the clause was intended to invoke means-plus-function treatment, and that the use of a structural term in the clause did not vitiate this intent, given the statement in the specification that the disclosed "spring 46 is an example of spring means tending to keep the door closed." In other words, the use of the words "is an example of" did not stop the court from limiting the claim to that example. *Id.*

The Court finds that the term "library" does not provide sufficient structure to overcome the presumption that the patentees' use of the term "means for" was not intended to invoke § 112, ¶ 6. Even if the term "library" is considered a structural term, the remainder of the clause invokes means-plus-function treatment, and the use of a structural term in the clause does not vitiate the patentees' intent. *See Unidynamics Corp. v. Automatic Prods. Int'l Ltd.*, 157 F.3d at 1319 (citing *Laitram Corp. v. Rexnord, Inc.*, 939 F.2d 1533, 1536, 19 USPQ2d 1367, 1369 (Fed. Cir.1991) ("The recitation of some structure in a means-plus-function element does not preclude the applicability of section 112.")).

Moreover, a generic library by itself is not integrated with the claimed invention and does not make the information available. A particular kind of library, a "source material library" is required in the claimed invention.[5]

---

[5]Every section of the specification that Acacia relies on in support of its position that "library" connotes sufficient structure, makes reference not to a "library" but instead a "source material library." *See* '992 patent, 2:65-66 ("Additionally, the present invention comprises a receiving system responsive to a user input identifying a choice of an item stored in a **source material library** to be played back to the subscriber at a location remote from the **source material library**.") (emphasis added); '992 patent, 6:23-30 ("The **source material library** 111, ... may preferably include a single source material library or a plurality of **source material libraries**. ... The plurality of **source material libraries** ...") (emphasis added); and '992 patent, 15:13-15 ("It is possible to process orders and operate a database of available titles at multiple locations remote of the **source material library 111**.") (emphasis added).

Moreover, comments made by the applicants during the prosecution of the '992 patent require that the library means be limited to the corresponding structure identified in the specification as the "source material library." In the First Office Action of the '992 patent application, the examiner rejected claims 1-6, and a multitude of others as being anticipated by "*Lang*." (Miller Decl., January 8, 2004; Ex. B at 183-185). The examiner stated that "*Lang* discloses a video/audio storage system which is capable of providing information to remote locations. See Fig. 2 for library means (11)." *Id.* at 183 (emphasis added). The applicants disagreed with the examiner. They asserted that *Lang* envisioned a library at some time in the future because *Lang* lacked the knowledge of how to incorporate such a library. *Id.* at 209. Applicants stated that they solved the problems left open in *Lang*. *Id.* The applicants further disputed whether *Lang* disclosed the recited identification encoding means "because the functions of the identification encoding means are to retrieve of [sic] information from the source material library means and to assign a unique identification code to the retrieved information." *Id.* Thus, to overcome *Lang*, the applicants disavowed any corresponding structure of "library means" other than a "source material library."

Having concluded that "library means" is drafted in means-plus-function form, construction of that limitation requires two steps. *Asyst Techs., Inc. v. Empak, Inc*., 268 F.3d 1364, 1369 (Fed. Cir. 2001). First, the Court must identify the function recited in the claim. *Id.* "Second, the court must identify the corresponding structure set forth in the [specification] that performs the particular function set forth in the claim." *Id.*

The function of "library means" is "storing items containing information."

The Court construes the term "items containing information" to mean "items containing information in analog or digital format." The limitation requiring the information be stored in analog or digital format is necessary as the conversion means element 113 only converts analog and digital inputs into a "formatted data" output.[6] ('992 patent, figure 2a). To preserve validity of the patent, the applicants limited claim 1 of the '992 patent as well as other claims involving a source material library to envelop only retrieving "information in the items." ('992 patent, 20:19). Although the specification discloses musical instruments and books being stored in the source material library, it does not enable retrieval of such items, much less conversion of such information in the items into the required input format acceptable by the conversion means (figure 2a (113)). ('992 patent, figure 2a).

///

///

///

///

///

///

///

---

[6]Neither the claims nor the specification of the '992 patent disclose any structure for converting information in the "items" to analog or digital form as required by the "conversion means," before the items are stored in the library means. The claims and the specification disclose structure (figure 2a (113)), which converts only analog or digital information. Before the items are stored, the information in the "items" stored in the library means must out of necessity already be in analog or digital format.

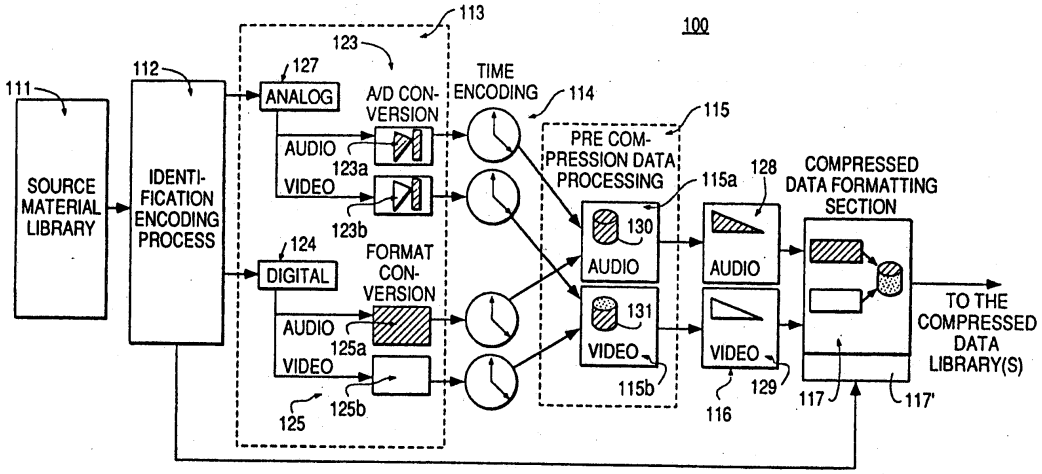

FIG. 2a

The Court finds that the corresponding structure of "library means" is the "source material library," as represented by block 111 of Figure 2a of the '992 patent. The claim element covers this corresponding structure and its equivalents.[7]

3. "identification encoding means for retrieving the information in the items from the library means and for assigning a unique identification code to the retrieved information"

a. "identification encoding means"

The parties agree that the term "identification encoder means" should be construed under § 112, ¶6. The identification encoding means disclosed in claim 1 of the '992 patent has two functions: (1) "retrieving the **information in the items** from the library means" and (2) "assigning a **unique identification code** to the retrieved information." ('992 patent, 20:19-21) (emphasis added). The Court will construe these two functions and then look to the specification

[7] In addition to reasons stated above, a "compressed data library" is not considered a corresponding structure of a library means because it represents the corresponding structure for a "compressed data storing means." Compare claim 1 of the '992 patent col. 20, line 17 ("library means ...") with line 32 ("compressed data storing means, coupled ..."). *See e.g.* '992 patent at 12:48, 12:59-66, and 13:9-13.

for corresponding structure.

1. retrieving the “information in the items from the library means”

The Court gives the term "retrieve" its ordinary meaning -- "to get something back." In this case, the function of the identification encoding means is to get back the information that is contained in the items which are stored in the source material library.

2. assigning a "unique identification code to the retrieved information"

Although it is undisputed that the “identification encoding means” must assign a “unique identification code,” the parties dispute the meaning of the term "unique identification code." The term does not have a plain and ordinary meaning. The language of claim 1 of the '992 patent, clarifies that a unique identification code identifies information stored possibly in more than one file and that the unique identification code is stored in the presence of files containing the information to be stored.

The specification refers to a "unique address code" that is not synonymous with the unique identification code. The "unique address code is an address for uniquely identifying the compressed data items stored in the compressed data library section of a library system." ('992 patent, 10:48-50). "The unique address code makes access to the requested data possible." ('992 patent, 10:64-65). Also separately defined in the specification and thus not to be considered a unique identification code is program notes and popularity codes. ('992 patent, 6:48-54).

In summary, the unique identification code is not a genus that includes all other codes, such as, the popularity code, unique address code, program notes, item title, and file name. Instead, the unique identification code is assigned by the identification encoding means and accompanies information stored as compressed sequenced data through the data compression process. ('992 patent, 10:20-22).

The specification is ambiguous, *inter alia*, with regards to whether the unique identification code is assigned to "the item" or to "the information in the item."

For instance, in the specification states:

> "[p]rior to being made accessible to a user of the transmission and receiving system of the present invention, the item must be stored in at least one compressed data library 118, and given a unique identification code by identification encoder 112."

('992 patent, 6:35-39).

This passage can reasonably be read to provide that the item itself is stored and that the item itself is given a unique identification code.

In another instance, the specification describes that a file containing compressed audio and video data "is addressable through the unique identification code assigned to the data by the identification encoder 112." ('992 patent, 10:28-30). This language suggests that the unique identification code is assigned to "data," which means the information in the item.

Similarly, the "Summary of the Invention" section of the specification describes the identification encoder means assigning a unique identification code to information retrieved from the source material library. ('992 patent, 2:33-34).

Accordingly, the Court construes the function "assigning a unique identification code to the retrieved information" to mean "assigning a one-of-a-kind identifier to the information retrieved from an item that identifies the retrieved information through the conversion, ordering, compression, and storing processes."

The Court now examines the specification for corresponding structure which performs these functions.

Acacia contends that the structure corresponding to the "identification encoding means" is:

(1) a human being;

(2) computer software;

(3) an identification encoder, and all equivalents.[8]

[8]"[A] person (*e.g.* system operator), an identification encoder, and computer software having source material utilization capabilities, and all equivalents thereof." (Joint Claim Construction Chart, Docket Item No. 151).

Defendants contend that there is no corresponding structure because (1) human beings are not structures, (2) the dispatching control software disclosed in the specification is not linked to the identification encoder, and (3) the "identification encoder" is a functional term that does not connote structure. The Court will consider these in order.

(1) A Human Being As Corresponding Structure for the Identification Encoding Means"

To support its argument that a human being is disclosed in the specification as corresponding structure for the "identification encoding means," Acacia refers to a passage in the specification which mentions a human being:

> FIG. 7 is a flow chart 400 of a preferred method of distribution of the present invention. The distribution method is preferably responsive to requests identifying information to be sent from the transmission system 100 to remote locations. **Method 400 assumes that the items have already been stored in compressed data library 118.**
>
> As illustrated in FIG. 7, **the first step of the distribution method 400 involves retrieving the information for selected items in the source material library 111, upon a request by a user of the distribution system (step 412). This is analogous to taking books off of a shelf at the local public library after the person has decided that he or she would like to read them.**

('992 patent, 18:46-59) (emphasis added).

Defendants contend that this reference to a person taking books off of a library shelf as analogous to a distribution "method" is not disclosure of a human being as corresponding structure of "identification encoding means." Defendants point out that the specification refers to a method and make no reference to the structure under consideration. In addition, Defendants point out that in the cited analogy the item itself is retrieved by the person. The claim requires corresponding structure for retrieving "the information in the item."

The Court finds that the language of claim 1 supports Defendants' position. As discussed above, corresponding structure to the "identification encoding means" must retrieve "**the information in the items** from the library means." ('992 patent, 20:19-20) (emphasis added).[9]

[9] Claim 1 of the '992 patent recites, in pertinent part, that:

1. A transmission system for providing information to be

The specification describes "retrieving the information for selected items in the source material library" and does not mention retrieving the item itself.[10] ('992 patent, 18:53-56).

Except for the Figure 7 analogy above to a library user, there is no other discussion in the specification which could be understood by one skilled in the relevant art as disclosing a human being as corresponding structure for performing the functions of the "identification encoding means." ('992 patent, 20:19-20).[11]

Therefore, the Court finds that there is no disclosure in the specification of a human being as corresponding structure for the identification encoding means. Accordingly, the Court declines to include a human being as corresponding structure in its construction of the "identification encoding means."

(2) The Dispatching Control Software As Corresponding Structure to the "Identification Encoding Means."

Acacia contends that a computer software program, the dispatching control software, is disclosed as corresponding structure of the "identification encoding means."

Computer software that performs uncommon functions can be corresponding structure in a means-plus-function element if the algorithm or enabling software is disclosed. *See Medical Instrumentation & Diagnostics Corp.*, 344 F.3d at 1211 ("The correct inquiry is to look at the

---

> transmitted to remote locations, the transmission system comprising:
>
> library means for storing items containing information; identification encoding means for retrieving **the information in the items** from the library means and for assigning a unique identification code to the retrieved information; ...

('992 patent, 20:14-22).

[10]The Court notes that the elements of the patent under consideration do not claim a structure for retrieving the items themselves. The Court leaves for later consideration the effect, if any of no structure for retrieving the items from the library means.

[11] Because the specification of the '992 patent, does not disclose a human being as a corresponding structure for the identification encoding means, the Court does not reach the legal issue of whether a human being can even be a corresponding structure.

disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass software for digital-to-digital conversion and been able to implement such a program, not simply whether one of skill in the art would have been able to write such a software program."); *S3, Inc. v. Nvidia*, 259 F.3d 1364, 1369 (Fed. Cir. 2001) ("The claims are directed to the invention that is described in the specification; they do not have meaning removed from the context from which they arose.") (internal quotations omitted).

In the specification, no algorithm for the "dispatching control software"[12] is disclosed to explain how the information in the items stored in the source material library is allegedly retrieved by the software. *See WMS Gaming, Inc. v. Int'l Game Tech*, 184 F.3d 1339, 1348-49 (Fed. Cir. 1999); *see also Tehrani v. Hamilton Med., Inc.*, 321 F.3d 1355, 1362-63 (Fed. Cir. 2003).

In addition, in a means-plus-function claim element, in order for a structure disclosed in the specification to qualify as "corresponding," there must be language in the specification, which would lead one skilled in the art to link that structure to the function. *Medtronic, Inc. v. Advanced Cardiovascular Sys., Inc*., 248 F.3d 1303, 1313 (Fed. Cir. 2001) (finding particular structures not to be corresponding structures because "one skilled in the art would not perceive any clear link or association between these structures and the [recited] function of connecting adjacent elements together").

The specification does not disclose the dispatching control software as structure for the identification encoder means, but instead discloses using the software to receive requests from the remote order processing and item database, and to send requests for information through the distribution system. ('992 patent, 17:54-57). In other words, the dispatching control software, *inter alia*, controls the flow of requests, and maintains a list of the available titles in a particular compressed data library when particular titles are not available in the compressed data libraries. The dispatching control software is not a corresponding structure for the identification encoding means because it does not retrieve "the information in the items" but instead manages the

[12]To the extent the "identification encoder," which is discussed later in this order, is computer software, the specification does not disclose any algorithm or enabling software.

"efficient use of the available distribution channels." ('992 patent, 17:65-66).

"It is not proper to look to the knowledge of one skilled in the art apart from and unconnected to the disclosure of the patent." *Medical Instrumentation & Diagnostics Corp.*, 344 F.3d at 1212.

Here, one skilled in the art would not link the dispatch control software, which is linked to other functions, with the retrieving function of the identification encoding means.[13] Therefore, the Court declines to include "dispatching control software" as corresponding structure in its construction of "identification encoding means."

(3) An Identification Encoder As Corresponding Structure of the "Identification Encoding Means."

The Court now turns its attention to Acacia's contention that the specification discloses an apparatus identified as "identification encoder" as corresponding structure for the "identification encoding means."

The term "identification encoder" is used in the specification. In the specification of the '992 patent, the patentees explain that "[p]rior to being made accessible to a user of the transmission and receiving system of the present invention, the item must be stored in at least one compressed data library 118, and given a unique identification code by **identification encoder 112**." ('992 patent, 6:35-39). Figures 2a and 2b of the '992 patent demonstrate that the unique identification code must be assigned by the identification encoding process, Figure 2a (112), prior to the information being compressed and stored in the compressed data library, Figure 2b (118). A preferred embodiment describes that the transmission system having a "compressed data storing means, coupled to the compression means, for storing as a file the

[13] The specification does not support Acacia's contention that the dispatching control software coordinates the retrieval of information and items from the source material library. (Plaintiff's Supp. Briefing Re Identification Encoding Means, p. 4-7). The specification of the '992 patent states that "[t]he dispatch software may also preferably coordinate network traffic, source material library 111 utilization, source material library contents, and connection costs." ('992 patent, 17:61-64). The specification discusses dispatching control software with performing the function of managing the flow of requests such that there is effective utilization of the system not retrieving information in the items.

compressed sequenced data with the unique identification code received from the data compression means." ('992 patent, 10:18-22) (emphasis added). The specification describes that a file containing compressed audio and video data "is addressable through **the unique identification code assigned to the data by the identification encoder 112**." ('992 patent, 10:28-30).

Although the specification identifies a structure called an "identification encoder" (block 112 in Figure 2a), because the Court is construing a means-plus-function claim, the Court must examine the specification to determine the substance of the identified structure and to determine if the identified structure performs the required functions.

Other than the term itself, the specification contains no description of the structure of an "identification encoder." It is unclear whether it is hardware, software, or as claimed with another element, a human being.

Thus, the issue is whether the use of the term, "identification encoder," without further description connotes sufficient structure to define the bounds of the invention. Acacia contends "identification encoder" can be computer software. However, the specification only defines the identification encoder by its function of assigning a unique identification code and does not disclose any structure, not even computer software.

In a means-plus-function claim, the patentee must disclose sufficient structure in the specification that one of ordinary skill in the art would recognize as being capable of performing the claimed function.[14] In the absence of such a link, the Court cannot create one. *Medical Instrumentation & Diagnostics Corp. v. Elekta AB*, 344 F.3d 1205 (Fed. Cir. 2003).

In the *Medical Instrumentation & Diagnostics Corp.* case, the lower court concluded that "the specification is not very explicit in its disclosures of a means for performing a

---

[14] The '992 patent issued in 1992. Prior to 1994, the United States Patent and Trademark Office ("PTO") did not examine applications for compliance with the corresponding structure requirement of § 112, ¶ 6. *See In re Donaldson*, 16 F.3d 1189, 1194 (Fed. Cir. 1994). In *In re Donaldson*, the Federal Circuit ended the "PTO's sweeping and long-standing practice of not applying paragraph six during examination." *Id.* The Federal Circuit explained that "the fact that the PTO may have failed to adhere to a statutory mandate over an extended period of time does not justify its continuing to do so." *Id.*

digital-to-digital conversion." *Medical Instrumentation & Diagnostics Corp.*, 344 F.3d at 1211. Nevertheless, the lower court concluded that because techniques for performing those conversions were known to those of skill in the art at the time the application was filed, a person of skill in the art would understand software to be a corresponding structure for the converting function. *Id.*

On appeal, the Federal Circuit explained that the patentee, MIDCO, presented evidence before the district court that a skilled programmer at the time of the application's filing could have written a program for digital-to-digital conversion of image size. *Id*. at 1212. Also, MIDCO provided examples of programs for digital-to-digital image conversion that would have been available at the time the patent was filed. *Id.* The Federal Circuit noted, however, that none of the examples of programs for digital-to-digital conversion were cited in the patent. *Id.*

After acknowledging that a district court should look at the disclosure from the point of view of one skilled in the relevant art, *id.* (citing *Budde v. Harley-Davidson, Inc.*, 250 F.3d 1369, 1376 (Fed. Cir. 2001), the Federal Circuit reversed the lower court because its inquiry was not correct. The Federal Circuit explained that "[t]he correct inquiry is to look at the disclosure of the patent and determine if one of skill in the art would have understood that disclosure to encompass software for digital-to-digital conversion and been able to implement such a program, **not simply whether one of skill in the art would have been able to write such a software program**." *Id.* (emphasis added) citing (*Atmel Corp. v. Info. Storage Devices, Inc.*, 198 F.3d 1374, 1380 (Fed. Cir. 1999); *see also Omega Eng'g, Inc. v. Raytek Corp*., 334 F.3d 1314, 1331-32 (Fed. Cir. 2003) (explaining that statements from experts cannot be used to "rewrite the patent's specification" to create a clear link where the language in the specification provides none). "It is important to determine whether one of skill in the art would understand the specification itself to disclose the structure, not simply whether that person would be capable of implementing that structure." *Medical Instrumentation & Diagnostics Corp.*, 344 F.3d at 1212 (citing *Atmel*, 198 F.3d at 1382 ("Fulfillment of the § 112, ¶ 6 trade-off cannot be satisfied when there is a total omission of structure. There must be structure in the specification.")).

In this case, the Court cannot define the term "identification encoding means" because there is no corresponding structure in the specification that is linked to the functions recited in the claims.[15] If the Court adopts this finding as its final conclusion on this matter, this would render claims 1, 3, 4, 5, 9, 10 and 11 of the '992 patent indefinite.

The Court invites Acacia to file a motion for an evidentiary hearing on the issue of whether one of skill in the art could identify a corresponding structure and determine the bounds of the "identification encoding means" in view of the specification.

The Court invites the Defendants to file a motion for summary judgment that the term "identification encoding means" is indefinite, rendering claims 1, 3, 4, 5, 9, 10 and 11 of U.S. Patent 5,132,992 to be invalid, respectively, pursuant to 35 U.S.C. § 112, ¶ 2. At the same time, Defendant may file a motion for summary judgment pursuant to § 112, ¶ 1.[16]

The Court will consider these invited motions in accordance with the procedure set forth in the "Conclusion" section of this Order.

///

///

///

///

---

[15]The encoding means identified in claim 1 of the '992 patent has two functions: (1) "retrieving the information in the items from the library means" and (2) "assigning a unique identification code to the retrieved information." ('992 patent, 20:19-21). Although the specification does disclose a human being assigning a unique identification code, it does not disclose what structure he uses to accomplish this function other than the identification encoder (Figure 2a (112)). As mentioned above, the specification does not disclose any structure for the term "identification encoder." Thus, the Court is unable to define a corresponding structure to the "identification encoding means" that is linked to the function of "assigning a unique identification code."

[16] Section 112, ¶ 2 is directed at the claims of the invention, while § 112, ¶ 1 is directed at the relationship of the claims to the specification. Federal Circuit case law allows a district court to address validity under § 112, ¶ 2 during claim construction. Notwithstanding, the Court postpones ruling on the validity of claims under § 112, ¶ 2 until the parties have had an opportunity to present expert testimony. In the interest of time and progressing the litigation initiated in 2002, the Court will also address motions for summary judgment regarding § 112, ¶ 1 on terms that the Court has construed or attempted to construe.

4. "conversion means, coupled to the identification encoding means, for placing the retrieved information into a predetermined format as formatted data; **ordering means, coupled to the conversion means, for placing the formatted data into a sequence of addressable data blocks"**

a. "conversion means"

The parties do not dispute the meaning of the term conversion means. For clarification of how the term interacts with other disputed terms, the Court notes the meaning of the term. The function of the conversion means is to "place retrieved information into a predetermined format." The specification discloses the "converter," figure 2a (113), as the corresponding structure. The specification explains that "after identification encoding is performed by identification encoder 112, the retrieved information is placed into a predetermined format as formatted data by the converter 113." ('992 patent, 6:59-63). The specification defines the inputs to the converter as data in analog or digital form. ('992 patent, 6:62-66) ("The items stored in source material library 111 and encoded by identification encoder 112 may be in either analog or digital form. Converter 113 therefore includes analog input receiver 127 and digital input receiver 124.").

b. "ordering means"

Pursuant to § 112, ¶6, the "ordering means, coupled to the conversion means" limitation of claim 1 of the '992 patent recites the function of "placing items into a sequence of addressable data blocks." The corresponding structure of the ordering means is the "time encoder (Figure 2a (114)." ('992 patent, 7:59-8:2 and 8:59-62). The claim element covers this corresponding structure and its equivalents.

c. "coupled to"

The Court construes the phrase "coupled to" to have its plain and ordinary meaning, which is "directly connected to or attached to." *See e.g.* Webster's Ninth New Collegiate Dictionary 298 (1991) (defining "couple" to mean: to connect for consideration together); *see also CCS Fitness*, 288 F.3d at 1366 (holding that there is a heavy presumption that a claim term carries its ordinary and customary meaning). The term "coupled to" as used in the claims and specification means two elements are directly attached to one another such that using a diskette

to transfer information from one to another would mean that the two computers are not "coupled to" one another.[17]

d. "placing the formatted data into a sequence of addressable data blocks" (claim 1 and 41 of the '992 patent)

In light of the Court's construction of the term "ordering means," the phrase "placing the formatted data into a sequence of addressable data blocks" does not require construction.

5. "compressed data storing means, coupled to the data compression means, for storing as files the compressed, sequenced data blocks received from the data compression means with the unique identification code assigned by the identification encoding means"

a. "compressed data storing means" (claim 1 of the '992 patent)

Pursuant to § 112, ¶ 6, the functions of the "compressed data storing means" inherent in the phrase "for storing as files" are (1) creating a file and (2) storing the file. The corresponding structure for creating and storing a file is the compressed data formatter 117. The claim element covers this corresponding structure and its equivalents. The corresponding structure for storage of the file is the compressed data library 118.[18] ('992 patent, figure 2a and 2b). The claim element covers this corresponding structure and its equivalents.

b. "coupled to" (claim 1 of the '992 patent)

As explained above, the Court construes the phrase "coupled to" to have its plain and

---

[17] Similarly, transferring a diskette from one computer to another would not make the two computers "in data communication with" one another. *See '702 patent claims.*

[18] The Court does not address in this Order whether the specification of the '992 patent discloses sufficient structure for any term, in particular, the "compressed data formatter." *See Atmel*, 198 F.3d at 1382 (holding that Section 112, ¶ 6 "represents a quid pro quo by permitting inventors to use a generic means expression for a claim limitation provided that the specification indicates what structure(s) constitute(s) the means." "If our interpretation of the statute results in a slight amount of additional written description appearing in patent specifications compared with total omission of structure, that is the trade-off necessitated by an applicant's use of the statute's permissive generic means term.").

ordinary meaning, which is "directly connected to or attached to."

B. Claim 41 of The '992 Patent

With the disputed terms and phrases in bold font, claim 41 of the '992 patent recites:

> 41. A method of transmitting information to **remote locations**, the transmission method comprising the steps, performed by a transmission system, of:
>
> **storing items having information in a source material library**;
>
> retrieving the information in the items from the source material library;
>
> assigning a **unique identification code** to the retrieved information;
>
> placing the retrieved information into a predetermined format as formatted data;
>
> **placing the formatted data into a sequence of addressable data blocks**;
>
> compressing the formatted and sequenced data blocks;
>
> **storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code**; and sending at least a portion of the file to one of the remote locations.

('992 patent, 24:53 - 25:5).

1. "storing items having information in a source material library"

(claim 41 of the '992 patent)

The parties request that the Court construe the term "storing items having information in a source material library" that is an element in claim 41 of the '992 patent. Claim 41 in pertinent part recites: "[a] method of transmitting information to remote locations, the transmission method comprising the steps, performed by a transmission system, of: storing items having information in a source material library." ('992 patent, 24:54-56).

Acacia construes the phrase to mean "the act of placing items having information in a source material library for later use where a source material library is a place where source material is kept or a collection of such material, source material are physical things at the point of origin or procurement, items having information are units or members of groups which have

information, and information is any meaning assigned to data by known conventions." (Joint Claim Construction Chart, Docket Item No. 151). Acacia rebuts Defendants' assertion that the transmission system has readily accessible for use original source items of the transmission system in a library by citing the '992 patent, col. 18, lines 53-59, stating that act of retrieving the information for items is analogous to taking books off a shelf at the local public library.

Defendants construe "storing items having information in a source material library" to mean that "the transmission system has readily accessible for use (stores) original source items of the transmission system in a library," where library requires organization of the items. (Joint Claim Construction Chart, Docket Item No. 151). Defendants assert that Acacia initially required a library to be a collection of materials "arranged for ease of use" and that once Acacia abandoned its previous position Defendants added the phrase "organized collection."

The Court finds that the plain and ordinary meaning of the term "library" could mean either a collection of books or a place where books could be stored. The specification supports defining library to be a collection of original material, which contains analog or digital information, that the transmission system may convert, compress, and transmit. In other words, the specification defines the source material library as a collection of original sources of information. In the transmission system described in claim 41 of the '992 patent, the Court construes the phrase "storing items having information in a source material library" to mean "adding items having information to a collection of existing materials."

2. "storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code" (claim 41 of the '992 patent)

As a preliminary matter, the disputed phrase "storing, as a file, the compressed, . . ." is not a step-plus-function claim element as asserted by defendants ITI and Offendale. The claim does not employ the "step for" language that signals the drafter's intent to invoke § 112, ¶ 6; rather the claim employs the phrase "A method . . . comprising the steps . . . of," which is an acceptable way to draft method claims. *See Masco Corp. v. United States*, 303 F.3d 1316, 1327 (Fed. Cir. 2002). "Courts must be cautious before adopting changes that disrupt the settled expectations of

the inventing community." *Id.* (citations omitted). Defendants ITI and Offendale have failed to overcome the presumption that claim 41 should not be construed as a step-plus-function claim.

The parties dispute the meaning of the term "with." Consistent with the Court's claim construction of the term unique identification code, the Court construes the term "with" to mean "accompanying or in the presence of" such that sequenced data blocks are accompanied by a corresponding unique identification code when stored. The Court construes the phrase "storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code" to mean "storing, as a file, the compressed, formatted, and sequenced data blocks accompanied by its unique identification code."

C. The '702 Patent

The '702 patent has 42 claims, three of which are independent claims -- 1, 17 and 27. Every claim of the '702 patent is directed toward a "communication system," which comprises both a transmission system and a reception system. Independent claim 1 with the font of the disputed terms and phrases in bold recites:

> 1. A communication system comprising:
>
> **a transmission system at a first location in data communication with a reception system at a second location**, wherein said transmission system comprises
>
> **a sequence encoder**,
>
> **an identification encoder**, and
>
> a compressed data library in data communication with said **identification encoder**,
>
> wherein said **identification encoder** gives items in said compressed data library a unique identification code; and
>
> wherein said reception system comprises
>
> a **transceiver in data communication** with said transmission system,
>
> a storage device **in data communication** with said transceiver,
>
> user playback controls **in data communication** with said storage device,
>
> **a digital compressor in data communication** with said storage

device, and

a playback device **in data communication** with said digital decompressor.

('702 patent, 19:26-47).

1. "a transmission system at a first location in data communication with a reception system at a second location" (claims 1, 17 and 27 of the '702 patent)

Independent claims 1, 17, and 27 of the '702 patent all recite "a transmission system at a first location in data communication with a reception system at a second location." This claim limitation is made up of the following constituent phrases: "transmission system," "reception system," "in data communication with," "at a first location," and "at a second location." Each phrase will be addressed individually.

a. "transmission system" (various claims of the '702 and '992 patents)

Acacia's proposed construction of the term "transmission system" is: "an assembly of elements, such as people, machines, and/or methods, capable of functioning together to transmit signals."[19] In support of its construction, Acacia relies on *IEEE Standard Dictionary of Electrical and Electronic Terms*, Fifth Ed. 1405 (1993) (hereinafter "IEEE Dictionary") that defines "transmission system" to mean "in communication practice, an assembly of elements capable of functioning together to transmit signal waves" and one of nineteen different definitions of the term "system" regarding software that recites "[a] collection of people, machines, and methods organized to accomplish a set of specific functions." (Plaintiff's Claim Construction Brief May 7, 2004 at 14).

Acacia contends that the specification supports its plain and ordinary meaning of the term "transmission system" that includes humans acting as system operators. *See* Plaintiff's Claim

[19] Plaintiff also contends that the "transmission system may be located in one facility or may be spread over a plurality of facilities." The Court will address Plaintiff's contention *infra* in connection with "at a first location" and "at a second location."

Construction Brief (May 7, 2004) at 14 (citing '702 patent, 8:29-32; 10:36-39; 10:59-63; and 14:13-26).

Defendants' proposed construction of the term "transmission system" is the *IEEE Dictionary* definition of the term that recites "as assembly of elements capable of functioning together to transmit signal waves," where Defendants contend that "signal waves" are "electric signals." (Defendants' Claim Construction Brief May 7, 2004 at 8) (citing Miller Decl., ex. NN at 575). Defendants contend that the Court need not define "elements" as used in the *IEEE Dictionary* definition of the term "transmission system" because the claims of the '702 patent state the elements that comprise a transmission system, and that list does not include a human operator. Also, Defendants assert that a human cannot be a part of a claim because a human is not patentable subject matter as defined by 35 U.S.C. § 101.[20]

The Court finds "transmission system" to mean "an assembly of elements, hardware and software, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system."

b. "reception system"

The parties' respective positions regarding "reception system" are reciprocal to their respective positions regarding "transmission systems." The term "reception system" does not appear in the specification. Plaintiff's proposed construction of a "reception system" is: "an assembly of elements, such as people, machines, and/or methods, capable of functioning together to receive signals." Whereas, the Defendants' proposed construction is "an assembly of elements that function together to receive electrical signals from the transmission system."

The Court construes "reception system" to mean "an assembly of elements, hardware and software, capable of functioning together to receive items of information."

---

[20] Title 35 U.S.C. § 101 (1952) recites that:

> Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

c. "in data communication with"

Acacia's proposed construction of the phrase "in data communication with" is one of two IEEE definitions of the term "data communication," which is "the movement of encoded information by means of communication techniques." *See* Plaintiff's Claim Construction Brief (May 7, 2004) at 17 (citing IEEE dictionary at 305, Block Decl., ex. 11).

Defendants' contend that the phrase "in data communication with" never appears in the specification. Relying on a IEEE dictionary definition, Defendants' contend that "in data communication with" should be construed to mean "connected to allow transfer of electrical signals."

The plain and ordinary meaning to one of ordinary skill in the art of the phrase "in data communication with" is "one or more devices connected such that data is being transferred between the devices in real-time." Acacia's proposed construction does not account for the words "in" and "with" that indicate two or possibly more devices are in real-time connection with one another.

A thorough review of the specification does not reveal the use of the phrase "in data communication with," although the phrase is used in every independent claim of the '702 patent. Thus, the specification does not rebut the plain and ordinary meaning, and neither does the prosecution history.

The Court construes "in data communication with" to mean "one or more devices connected such that data is being transferred between the devices in real-time."

d. "at a first location"

The issue is whether claims reciting "a transmission system at a first location" limit the system to being located at a particular location notwithstanding the disclosures in the specification and use of the word "comprising" in the claims. Case law from the United States Court of Appeals for the Federal Circuit supports a finding that articles "an" or "an" may mean "one or more than one" in particular instances, especially in claims that use the transitional term "comprising." *See Elkay Mfg. Co. v. Ebco Mfg. Co.*, 192 F.3d 973, 977 (Fed. Cir. 1999); *Abtox, Inc. v. Exitron Corp.*, 122 F.3d 1019, 1023 (Fed. Cir. 1997).

The claim language "at a first location" requires that "a transmission system" be limited to one particular location. Absent from all of Acacia's briefing regarding this disputed phrase is any mention of the preposition "at," which is used to indicate presence or position, "staying at a hotel" or "located at the mall." *See e.g. Webster's Ninth New Collegiate Dictionary* 111 (1991). The claim language supports limiting "a transmission system at a first location" to a transmission system being at one and only one particular location or premises.[21, 22] *See Ethico EndoSurgery, Inc. v. U.S. Surgical Corp.*, 93 F.3d 1572, 1582 (Fed. Cir. 1996); *Exxon Chemical Patents, Inc. v. Lubizol Corp.*, 64 F.3d 1553, 1557 (Fed. Cir. 1995) (recognizing that "[w]e must give meaning to all the words in Exxon's claims.").

The specification supports the phrase "a transmission system at a first location" enveloping one single transmission system at a single location. Figures 1a, 1b, 1d, 1e, 1f and 1g of the '702 patent illustrate a transmission system at a single location.[23] The specification does not rebut the plain and ordinary meaning of the claim, which is more limited in scope than the specification.

The prosecution history does not refute the plain and ordinary meaning of the phrase or

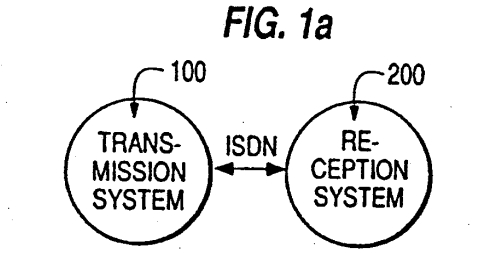
---

[21] As Plaintiff asserts, the use of the terms "first" and "second" is a common patent law convention to distinguish between repeated instances of an element or limitation, but the Court does not consider use of the phrases "at a first location" and "at a second location" in the '702 patent to qualify as repeated instances of an element or limitation. *See* Plaintiff's Opposition to Defendants' Claim Construction Brief (May 13, 2004) (citing *3M Innovative Products Co. v. Avery Dennison Corp.*, 350 F.3d 1365, 1371 (Fed. Cir. 2003)).

[22] Relying on the prosecution history of U.S. Patent No. 6,002,720 ("the '720 patent"), a patent in the Yurt Family of Patents, which the '702 patent derives by way of a divisional application based upon the '720 patent, Defendants' assert that term "location" should be construed to mean "premises." The term location is being applied in different context in that particular situation, and the Court elects not to rely on the prosecution history of a different patent, although the two patents share almost an identical specification, to construe the term location.

[23] As is often the case in the Yurt family of patents, the specification discloses a "high level block diagram" of the invention but does not explain the actual structural components (*e.g.* software or hardware) required to have a transmission system at more than one location. ('702 patent, 4:1). Thus, it is conceivable that the patentees limited the claim to not cover a transmission system in more than one location in an effort to preserve validity of the claims.

the way it is used in the claim language. In the Second Preliminary Amendment, the applicants added new claims, without commentary, to the '702 patent application and the phrase appeared as part of claims 33 (that issued as claim 1) and claim 50 (that issued as claim 27). ('702 Patent Prosecution History, Miller Decl., ex. GG at 115-16).



The Court construes "a transmission system at a first location" to mean "a transmission system at one particular location separate from the location of the reception system."

e. "at a second location"

The Court construes "a reception system at a second location" to mean "a reception system at one particular location separate from the location of the transmission system." ('702 patent, Fig. 1a). *See Andrew Corp. v. Gabriel Elec., Inc.*, 847 F.2d 819 (Fed. Cir. 1988) (holding the a patentee may claim less than the entire invention).

2. "sequence encoder" (claims 1, 7, 17 and 18 of the '702 patent)

Acacia contends that term "sequence encoder" as found in claims 1, 7, 17, and 18, does not invoke 28 U.S.C. § 112, ¶ 6 because there is no use of the "means" in the claim, the term connotes sufficient structure, and the term "encoder" is well-known to those skilled in the art of electrical engineering, electronics, and computing. *See* Plaintiff's Claim Construction Brief (May 7, 2004) at 17. Acacia contends that an encoder is "a device or system that encodes data." *Id.* (citing *IEEE Dictionary* at 437). Acacia asserts that a "sequence encoder" is "an encoder which creates a sequence." *Id.* at 18.

The Court finds that 28 U.S.C. § 112, ¶ 6 does not apply to construction of the "sequence encoder" claim element. Therefore, from the intrinsic record, if possible, the court must determine the plain meaning, if any, that those of ordinary skill in the art would apply to the term.

The term "sequence encoder" has no plain meaning. Although the general term "encoder" does have a plain meaning, namely, an apparatus which encodes, such a general meaning is not useful in making a determination of the meaning of an apparatus called a "sequence encoder." At most it appears to take a nonspecific function–encoding a sequence–and claim an apparatus for performing that function. Since there is no plain meaning, the Court looks to the patent specification for defining the apparatus.

The term "sequence encoder" never appears in the specification of the '702 patent.

The legal consequence of claiming an apparatus which has no plain meaning and which is not defined or referred to in the specification is for the Court to declare the patent claim indefinite.

Acacia acknowledges that "sequence encoder" does not appear in the specification of the '702 patent. To avoid indefiniteness, Acacia asserts the description of a time encoder in the specification clarifies that the time encoder is a sequence encoder. *See* Acacia's Opposition to Defendants' Claim Construction Brief (May 13, 2004) at 15. Citing *Personalized Media Communications,* Plaintiff's contend that if the phrase "digital detector" in that case connotes sufficient structure to avoid application of § 112, ¶ 6, so does "sequence encoder."

Unlike the "digital detector" in *Personalized Media Communications*, that was at least functionally described in a block diagram, the term "sequence encoder" does not appear at all in the drawings or specification of the '702 patent.

With absolutely no reference or drawing , one of ordinary skill in the art would not know what a sequence encoder is, or what structure the encoder has, and how it interacts with other elements of the transmission system. Furthermore, a person skilled in the art would not find a time encoder that "places the blocks of converted formatted information from converter 113 into a group of addressable blocks" to be synonymous with a "sequence encoder." A time encoder that is described in dependant claim 7 of the '702 patent is a limitation describing an additional

function of the sequence encoder but does not assist one skilled in the art with defining the boundaries of the claimed element, "a sequence encoder." *See Ecolab, Inc. v. Paraclipse, Inc.*, 285 F.3d 1362, 1375 (Fed. Cir. 2002).

"As mandated by the definiteness requirement of 35 U.S.C. § 112, ¶ 2, a specification shall include claims 'particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention'" *Personalized Media Communications*, 161 F.3d at 705 (citing 35 U.S.C. § 112, ¶ 2). "Determining whether a claim is definite requires an analysis of 'whether one skilled in the art would understand the bounds of the claim when read in light of the specification.... If the claims read in light of the specification reasonably apprise those skilled in the art of the scope of the invention, § 112 demands no more.'" *Id.* (citing *Miles Lab., Inc. v. Shandon, Inc.*, 997 F.2d 870, 875 (Fed. Cir. 1993)).

Here, one of ordinary skill in the art would not be able to understand the bounds of the claim element, a sequence encoder, because the specification never mentions the term at all. The term "encoder" is a generic term to which the modifier "sequence" does not add clarity to one skilled in the art. The term "sequence encoder" not appearing at all in the specification distinguishes the case at hand from *Personalized Media Communications*, where the specification explicitly defined a "digital detector" as a device that "acts to detect the digital signal information" in another stream of information.[24] *Personalized Media Communications*, 161 F.3d at 706. Also, in *Personalized Media Communications*, the patentee asserted that the specification clearly apprises one of ordinary skill of the scope of the term. Acacia cannot suggest the general public is on notice of the scope of the term "sequence encoder" as the term never appears in the specification. Because the term "sequence encoder" does not appear in the specification of the claim, extrinsic evidence, such as expert testimony, may not be useful to the Court, as the intrinsic evidence appears unambiguous. *Id.* at 706 ("Extrinsic evidence may not be

---

[24] Also, in *Personalized Media*, the patentee asserted that the specification clearly apprises one of ordinary skill of the scope of the term. In the case at hand, Acacia cannot suggest the one of ordinary skill in the art is on notice of the scope of the term "sequence encoder" as the term never appears in the specification.

relied upon during claim construction when the intrinsic evidence unambiguously defines the disputed claim language.") (citing *Bell & Howell Document Mgmt. Prods. Co. v. Altek Sys.*, 132 F.3d 701, 706 (Fed. Cir. 1997). If the Court adopts this finding as its final conclusion on this matter, this would render claims 1, 7, 17, 18, 32 and 33 of U.S. Patent No. 6,144,702 indefinite.

The Court directs Acacia to file a motion for an evidentiary hearing and Defendants to file motions directed to, *inter alia*, the legal consequence that "sequence encoder" is indefinite.

3. "identification encoder" (claims 1, 5, 6, 17, 19, 27 and 31 of the '702 patent)

The parties dispute the meaning of the term "identification encoder" that is found in claims 1, 5, 6, 17, 19, 27 and 31 of the '702 patent.[25] Acacia contends that "identification encoder" should be construed to mean "a device or software capable of expressing the identification of an item in terms of code."

Defendants contend that "identification encoder" does not connote structure to one skilled in the art. Defendants' position is that the patentees use of the term "identification encoder" is functional claiming. In support of their position, Defendants cite to the prosecution history where the applicant's modified the identification encoder by requiring it to assign a unique identification code. Specifically, Defendants contend that the specification does not describe how the identification encoder assigns a unique identification code, a limitation added by the applicants to overcome a rejection in view of *Tindell*. (Defendants' Claim Construction Brief May 7, 2004 at 16). The applicants stated that the limitation was added too "more clearly define the **function** of the identification encoder." (Miller Decl., ex. KK at 165) (emphasis added).

Defendants assert that because "identification encoder" is a functional term, § 112, ¶ 6 applies. Defendants contend that there is no corresponding structure disclosed in the specification. (Defendants' Claim Construction Brief May 7, 2004 at 17). Because there is no

[25]Consideration of the term "identification encoder" for this patent is on a different legal footing than consideration of this same term as corresponding structure of a means-plus function claim in the '992 patent, since here there is no requirement that the Court first identify the function which the apparatus must perform and then look to the specification for corresponding structure which performs that function.

corresponding structure disclosed for the functional term, Defendants contend that the Court cannot construe the claim in accordance with § 112, ¶ 6 such that pursuant to § 112, ¶ 2 claims with the term "identification encoder" are invalid for indefiniteness. *Id.*

The Court finds that 28 U.S.C. § 112, ¶ 6 does not apply to construction of the "identification encoder" claim element.[26] Therefore, from the intrinsic record, if possible, the court must determine the plain meaning, if any, that those of ordinary skill in the art would apply to the term.

The term "identification encoder" has no plain meaning. Although the general term "encoder" does have a plain meaning, namely, an apparatus which encodes, such a general meaning is not useful in making a determination of the meaning of an apparatus called a "identification encoder." At most it appears to take a nonspecific function–encoding an identification–and claim an apparatus for performing that function. The five prior art patents cited by Acacia that disclose an identification encoder in five completely different ways, none of which are applicable here nor cited by the patents-in-suit, further exemplifies that one of skill in the art would not understand the meaning of the term "identification encoder." (Block Decl. ex. 24-28).

Since there is no plain meaning, the Court looks to the patent specification for defining the apparatus. Here, the specification of the '702 patent only discloses an identification encoder as a box that performs the function of assigning a unique identification code. ('702 patent, 6:30-39). The specification does not disclose an algorithm, software or apparatus to perform the function of assigning a unique identification code. Thus, one of ordinary skill in the art would not understand the scope or bounds of the claim, when it is read in light of the specification rendering an "identification encoder" insolubly ambiguous.

Although arguably indefinite, the Court construes "identification encoder" to mean "a

---

[26] The Court considers the term "identification encoder" to be indefinite consist with the Court's analysis of the term "identification encoding means." However, due to the rules of claim construction the Court does not believe it is appropriate to apply a means-plus-function analysis where the patentee has not chosen to raise the presumption by using the phrase "means for."

structure that assigns a unique identification code." The Court declines to address further the issue of indefiniteness during claim construction. The Court invites Defendants to file a motion for summary judgment pursuant to § 112, ¶ 1 and ¶ 2 regarding the term "identification encoder."

4. "transceiver" (claims 1, 17 and 27)

The parties do not dispute that a "transceiver" is "a device capable of both sending and receiving information." However, the parties dispute whether that device must share circuit components. The *Dictionary of Computing*, 3rd ed. (1990), cited by both parties defines as a transceiver as follows:

> Acronym for transmitter and receiver. A device that can both transmit and receiver signal on a communication medium. Many communication devices, including *modems, *codecs, and terminals, are transceivers.

Dictionary of Computing 474 (3rd ed. 1990).

Defendants contend that examples of transceivers listed in the *Dictionary of Computing* are devices that perform two functions using shared circuitry; such as modems, an acronym for a device that is a modulator and demodulator; and codecs, an acronym for a device that is a coder and decoder.

In the specification, the description of a transceiver is at a block level that does not elaborate on the workings of the transceiver, much less its circuitry. The specification does illustrate the transceiver as a single box on figures 2b and 6 of the '702 patent.

The Court construes "transceiver" to mean "a singular device capable of both sending and receiving information."

5. "wherein said identification encoder allows entry of a popularity code" (claims 6 and 27 of the '702 patent)

The disputed phrase "wherein said identification encoder allows entry of a popularity code" appears in claims 6 and 27 of the '702 patent. Acacia's proposed construction of the phrase is: "a popularity code is the symbols, letters, or words or combinations thereof used to represent the popularity of a particular item. The identification encoder allows entry of the popularity code." *See* Plaintiff's Claim Construction Brief at 28 (May 7, 2004).

Defendants contend that Acacia's definition is too broad. Defendants assert that the specification discloses a specific function in the transmission system "[t]he popularity code can be used to determine the most appropriate form of media storage of the compressed data in a mixed media system." (Defendants' Opposition to Plaintiff's Claim Construction May 13, 2004 at 18) (citing '702 patent, col 12, ll. 8-10). "In some cases, where multiple compressed data libraries 118 are organized, the popularity code may dictate the distribution of a particular item to multiple distribution systems." ('702 patent, 12:41-43).

"The storage encoding process performed by [the] identification encoder 112 allows entry of a popularity code." ('702 patent, 12:4-5). According to figure 2a, the "identification encoding process" occurs as the first step of converting material in a source material library into a format suitable for storage in a compressed data library and subsequent transmission. ('702 patent, fig. 2a). The specification indicates that the "popularity code is preferably assigned on the basis of how often the corresponding item is expected to be requested from the compressed data library 118." ('702 patent, 12:6-8).

The specification mentions that the popularity code may be updated by "factoring item usage against system usage." ('702 patent, 12:12-13). However, the specification does not disclose an algorithm, software program, or even a high level block diagram of how requests for a particular item (with copies possibly in other locations) is tracked by the popularity code and how the code is updated.

The specification does not disclose using a popularity code to retrieve items of information, but rather discloses the popularity code as a way of efficiently determining what storage media should be used for particular information to enhance retrieval. For example, how often an item of information is retrieved from the compressed data library determines whether the item is stored on cassette tapes (lower number of requests) or magneto-optical disks (highest number of requests). ('702 patent, 12:20-23). If a popularity code is assigned, the popularity code dictates distribution of a particular item to multiple distribution systems. ('702 patent, 12: 41-43).

Acacia contends that the term "popularity code" has a plain and ordinary meaning such that the Court need not look to the specification to define the term. While a term "popularity rating" connotes a meaning that it is a rating of how popular an item is, the same does not hold true for a "popularity code." Even if the term had a plain and ordinary meaning, which it does not, the patentees acted as their own lexicographers in assigning a specific meaning to the term in one of the few portions of the specification that are unambiguous.

As defined in the specification of the '702 patent, the popularity code, if assigned, has no function separate from the compressed data library. ('702 patent, 12:5-47). Accordingly, the Court construes "popularity code" to mean "a code that indicates initially the projected requests for an item of information in the compressed data library relative to other items contained therein for purposes of determining its place in the storage hierarchy; where said popularity code may be updated over time to reflect actual requests from users for particular information."

The Court construes "wherein said identification encoder allows entry of a popularity code" to mean "an identification encoder assigns an optional popularity code."[27]

6. "temporary storage device" (claims 14 and 41 of the '702 patent)

Acacia contends that "temporary storage device" should be construed to mean "a device into which data may be placed, retained for a limited time, and retrieved" or in accordance with the definitions cited by Defendants, "a storage device capable of storing data on an intermediate, or impermanent, basis."

Defendants contend that "[i]n the context of data transmission, one of skill in the art would understand that a temporary storage device is a device in which data may be stored on an

---

[27] During the prosecution of the '992 patent, the applicants disagreed with the examiner that *Lang* disclosed the recited "identification encoding means." The applicants explained that "the functions of the identification encoding means are to retrieve of [sic] information from the source material library means and to assign a unique identification code to the retrieved information." *Id.* Thus, in addition to retrieving information from a source material library means and assigning a unique identification code to the retrieved information, here said identification encoder must perform the additional step of assigning an optional popularity code.

impermanent basis." (Defendant's Response to Plaintiff's Claim Construction May 13, 2004 at 25).

The plain and ordinary meaning of the term "temporary storage device" is defined by the intent of the person storing the information, not whether data is stored on media that can be overwritten. The specification supports the plain meaning by explaining in Figure 6 that "[s]torage 203 allows for temporary storage of the requested item until playback is requested." ('702 patent, 17:37-38). The prosecution history does not rebut the plain and ordinary meaning. The Court construes "temporary storage device" to mean "a device intended to store data for an impermanent basis and allows for stored data to be retrieved from the storage device while the data resides therein."

7. "Digital Compressor" Should Be Rewritten to Read "Digital Decompressor" (claim 1 of the '702 patent)

The Patent and Trademark Office ("PTO") made a typographical error when formatting the '702 patent, such that the term "digital decompressor" appeared as "digital compressor" in claim 1. *See* '702 patent, col. 19, l. 44. Plaintiff's requested a certificate of correction to correct the PTO's mistake on December 12, 2002 and obtained a certificate of correction on April 15, 2003.

At the May 19, 2004 *Markman* Hearing, Defendants agreed that an error had occurred and that the term "compressor" should be "decompressor," but Defendants position is that the error is major such that the Court does not have the authority to change "compressor" to "decompressor." The result of the Court not correcting the PTO's mistake is that all lawsuits filed prior to issuance of the certificate of correction would be governed by claim 1 having the term "compressor" in the claim instead of the corrected term "decompressor."

After the enactment of 35 U.S.C. §§ 254 and 255, the Federal Circuit has allowed district courts to continue to correct obvious minor typographical and clerical errors in patents. *See Novo Indus., L.P. v. Micro Molds Corp.*, 350 F.3d 1348, 1357 (Fed. Cir. 2003); *Lemelson v. Gen. Mills, Inc.*, 968 F.2d 1202, 1203 & n. 3 (Fed. Cir.1992) (adding the word "toy" to the preamble of a claim because "[t]he deletion of 'toy' appears from the record of the proceedings before the PTO

to have been an inadvertent error when the patent was printed rather than an amendment to the claim").

"A district court can correct a patent only if (1) the correction is not subject to reasonable debate based on consideration of the claim language and the specification and (2) the prosecution history does not suggest a different interpretation of the claims." *Novo Indus.*, 350 F.3d at 1357. Here, the parties do not debate that a mistake was made such that the term "compressor" should be replaced with the term "decompressor." Also, the subject is not subject to reasonable debate because the reception system receives compressed data and then decompresses the data in a decompressor, not a compressor. The second element of the test is met because during the prosecution history, claim 1 consistently appears with the correct term "decompressor" and not "compressor," a mistake that did not occur until publication of the patent.

The Court construes "digital compressor" in claim 1 of the '702 patent to mean "digital decompressor." *See I.T.S. Rubber Co. v. Essex Rubber Co.*, 272 U.S. 429, 442 (1926).

V. CONCLUSION

To promote judicial economy, the parties should meet, confer and file with the Court no later than August 6, 2004, a joint statement that lists all now pending motions and any motions which the parties propose to file in light of the Court's *Markman* Order. The joint statement shall include each party's individual priority list of the order in which the Court should hear the listed motions and a concise (no more than one-page per party) explanation why the Court should adopt a particular party's proposed schedule.

The Court sets a telephonic case management conference ("CMC") for August 17, 2004 at 11:00 a.m. Plaintiff is to coordinate and initiate the CMC. After the CMC, the Court will set a schedule for briefing and hearing any motions.

I. INTRODUCTION

Plaintiff Acacia Media Technologies Corporation ("Acacia") hereby moves for reconsideration and clarification of the Court's July 12, 2004 Markman Order ("Markman Order").

In this motion, Acacia seeks reconsideration of only three issues, and seeks clarification of three more. Acacia shall address the Court's analysis and construction of these terms and shall show why the Court should reconsider or clarify its constructions.

Acacia seeks reconsideration of the Court's construction of "transmission system" and "transmission system at a first location" to assure that the construction for each makes clear that the location of the transmission system is not limited to a single facility; i.e., the transmission system may be spread over a plurality of facilities. This is how the patentees specially defined the transmission system in the specification, and the specification and claim language chosen by the patentees fully supports this construction.

For the same legal and factual reasons, Acacia seeks reconsideration of the Court's construction of "reception system at a second location" to make clear that the location of the reception system is not limited to a single facility.

For the final issue for reconsideration, Acacia seeks claim construction of the phrase, "sequence encoder." Based solely on the intrinsic patent records, the Court tentatively ruled in its Markman Order that it could not construe the claim term "sequence encoder." The term "sequence encoder" is definite and should be construed as a "time encoder," because the specification teaches one of ordinary skill in the art that a time encoder places information into a sequence of addressable data blocks. Acacia will present expert testimony at the evidentiary hearing demonstrating that persons of ordinary skill in the art in January 1991 would have understood the meaning of "sequence encoder" when the claims are read in light of the specification. Further, this construction is confirmed by the rules of claim construction most recently enunciated in the Federal Circuit's *en banc* decision of *Phillips v. AHW Corp.*, ___ F.3d ___, 2005 U.S. App. LEXIS 13954 (Fed. Cir. 2005) (*en banc*)[1] and by established claim construction rules, such as claim differentiation.

[1] The Lexis version of the opinion in the *Phillips* case is attached as Exhibit 4 to the Block

Acacia seeks clarification of the Court's analysis of the construction of "identification encoder" to clarify an inconsistency in the Markman Order itself. The Court construed "identification encoder" as "a structure that assigns a unique identification code," but then made statements in the Markman Order that the "identification encoder" is "insolubly ambiguous" and "arguably indefinite." Acacia will present expert testimony at the evidentiary hearing demonstrating that persons of ordinary skill in the art in January 1991 would have understood the meaning of "identification encoder" when the claims are read in light of the specification, and the Court, based on that expert evidence and the intrinsic patent evidence, should delete from its order any statements describing the "identification encoder" as "indefinite" or "insolubly ambiguous.".

Finally, Acacia seeks clarification of one sub-phrase and one term contained in the Court's construction of the phrase "in data communication with." The Court construed that phrase as "one or more devices connected such that data is being transferred between the devices in real time." The sub-phrase "one or more devices" we clearly believe was intended by the Court to read "two or more devices," and this clarifying change should be made.

Based on the Court's order, we also understand that the Court selected the term "real-time" to describe the transfer of data between devices to exclude transferring data via diskette. We do not seek to disturb that intended result. We seek, however, to clarify, consistent with the express teachings of the intrinsic patent documents, that the transmission system may transmit video information in a fraction of the time it takes for a viewer to watch the video. Without this clarification, we suspect a jury will be confused and require the data to be sent from the transmission system to the receiving system at precisely the speed a viewer would watch a video, which of course is not contemplated by the specification at all.

Acacia looks forward to the evidentiary hearing on September 8 and 9 and respectfully requests that the Court adopt Acacia's proposed modifications to the Markman Order.

Declaration.

II. THE COURT SHOULD MODIFY ITS MARKMAN ORDER IN LIMITED RESPECTS

A. Acacia's Grounds for Reconsideration of the Court's Analysis and Construction of the Claim Term "Transmission System"

1. Acacia's Proposed, Reconsidered Construction of the "Transmission System"

Acacia respectfully requests that the Court amend its proposed construction of "transmission system" to reflect the following changes:

> "an assembly of elements, hardware and software, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system, the transmission system being located in one or more facilities."

This requested change is needed to avoid potential juror confusion. The fact that the Court's construction of "transmission system" does not specify that the transmission system may be spread over a plurality of facilities means that a defendant whose transmission system is spread over a plurality of facilities may attempt to argue that they do not infringe any of the claims of the '992 patent for this reason. The patentees clearly defined the transmission system as being located in one facility or spread over a plurality of facilities in the specification and they are entitled to a construction that includes this definition. (See, '992 patent, 5:61-63 and '702 patent, 5:58-60; Exhibits 2 and 3).

2. The Court Should Consider Acacia's Contention that the Transmission System is Located in One Facility or Spread Over a Plurality of Facilities

In its Markman Order, the Court declined to include in Acacia's requested claim construction that the transmission system may be located in one facility or may be spread over a plurality of facilities when considering its construction of the term "transmission system." (Markman Order, at page 27, n 19; Exhibit 1). Instead, the Court stated that it would address Acacia's contention when considering the claim terms "at a first location" and "at a second location." (*Id.*) For the reasons expressed below, this issue needs to be addressed in connection with both the "transmission system"

and the "at a first location" elements of both the '992 and '702 patent claims to avoid prejudice to Acacia, and to impart clarity and consistency to the Markman Order in connection with this single issue that affects two different claim terms.

The term "transmission system" is found in all of the claims of the '992 patent and in all of the claims of the '702 patent. In the '992 patent claims, unlike the '702 patent claims, the language "at a first location" is not present.[2] There is no language in the '992 patent claims susceptible to the meaning that the transmission system must be or even might be located only at a single, particular location. Similarly, there is no language in the '992 patent claims which precludes the transmission system from being spread over a plurality of facilities or from being located in more than one location.

The identical specification of the '992 and '702 patents could not be clearer in describing the transmission system as being located in one facility or spread over a plurality of facilities: "Transmission system 100 may either be located in one facility or may be spread over a plurality of facilities." ('992 patent, 5:61-63 and '702 patent, 5:58-60). The Federal Circuit emphasizes the importance of the specification in claim construction and the importance of construing a claim term consistent with a special definition given to the term by the patentee. *See*, *Phillips v. AHW Corp.*, __ F.3d __, 2005 U.S. App. LEXIS 13954, *33-*34 (Fed. Cir. 2005) (*en banc*) ("Consistent with that general principle [that the specification informs the proper construction of the claims], our cases recognize that the specification may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess.") The patentees in this case gave the term "transmission system" an expansive geographical meaning—it could be located in a plurality of facilities. That definition needs to be given effect in our claim construction.

[2] See, e.g., claim 19 of the '992 patent: "A distribution method responsive to requests from a user identifying items in a *transmission system* containing information to be sent from the *transmission system* to receiving systems at remote locations . . . storing, in the *transmission system*, information from items. . . sending a request, by the user to the *transmission system*, . . . sending at least a portion of the stored information from the *transmission system* to the receiving system. . ."

B. Acacia's Grounds for Reconsideration of the Court's Analysis and Construction of the Claim Term "Transmission System at a First Location"

1. Acacia's Proposed, Reconsidered Construction of "Transmission at a First Location"

Acacia respectfully requests that the Court amend its proposed construction of "transmission system at a first location" to reflect the following changes:

"a transmission system at one or more ~~particular~~ locations separate from the location of the reception system."

Again, this change is needed to conform the claim construction to the teachings of the specification. Moreover, as explained below, it is required to correct an error of law concerning the legal meaning to be accorded the word "comprising" in claim drafting, and certain mistakes of fact concerning the disclosures of the patent specification.

2. The '702 Patent Not Only Expressly States That the Transmission System Can Be at More Than One Locations, it Sufficiently Explains How a Transmission System at More than One Location Would Operate

In its Markman Order, the Court, in considering whether the phrase "transmission system at a first location" is limited to one particular location, stated: "[a]s is often the case in the Yurt family of patents, the specification discloses a "high level block diagram" of the invention but does not explain the actual structural components (e.g. software or hardware) required to have a transmission system at more than one location. ('702 patent, 4:1). Thus, it is conceivable that the patentees limited the claim to not cover a transmission system in more than one location in an effort to preserve validity of the claims." (Markman Order, at page 30, n 23; Exhibit 1).

These statements by the Court are not correct. With respect to the statement that the patents only disclose "high level" diagrams, the patents do disclose "detailed block diagrams" of the invention (*See*, '702 patent, 3:28-30: "FIGS. 2a and 2b are *detailed block diagrams* of preferred implementation of the transmission system of the present invention." *See also*, '702 patent, at 5:56-18:53 and Figures 2a and 2b; Exhibit 3; emphasis added).

The Court's statement that the patent specification does not explain the structural components required to have a transmission system at more than one location is also incorrect. The specification describes how a transmission system that is spread over a plurality of facilities would operate. For instance, the specification provides examples of transmission systems having multiple source material libraries and/or multiple compressed data libraries and describes how such transmission systems would operate. (See, e.g., '702 patent, 6:19-29; '702 patent, 10:19-24; '702 patent, 11:22-30; '702 patent, 12:41-47; '702 patent, 12:59-65; '702 patent, 14:43-45; '702 patent, 15:49-52; '702 patent 17:7-18; Exhibit 3). Regardless, there is no legal requirement for the patentees to have explained every structural element necessary to operate a transmission system that is spread over a plurality of facilities – the patentees are only required to provide an enabling disclosure such that one of skill in the art would have been able to make and use the invention without undue experimentation. *Koito Manufacturing Co., Ltd. v. Turn-Key-Tech, LLC*, 381 F.3d 1142, 1155-56 (Fed. Cir. 2004), *quoting, In re Gay*, 309 F.2d 769, 774 (CCPA 1962) ("'Not every last detail is to be described, else patent specifications would turn into production specifications, which they were never intended to be.'").

Further, the Court's statement above that "it is conceivable" that the patentees limited the claims of the '702 patent to a single location to preserve the validity of the claims is unsupported and in fact contradicted by the intrinsic patent documents. This issue was not raised in any of the prosecution histories, and the claim language used by the patentees was clearly intended to capture transmission systems located at multiple locations, so long as none of those transmission system facilities are located at the reception system.

The claiming convention used by the patentees and their prosecuting attorney demonstrate an intent to provide an expansive geographic meaning to the phrase "transmission system at a first location." The claims of the '702 patent use the open-ended transition term "comprising," meaning that the entire claim is presumptively open-ended. *See, The Gillette Company v. Energizer Holdings, Inc.*, 405 F.3d 1367, 1372 (Fed. Cir. 2005) ("The word 'comprising' transitioning from the preamble to the body signals that the entire claim is presumptively open-ended."). Open-ended means it is not limited. Therefore, the article "a" in the phrase "at a first location" should be

interpreted to mean "one or more than one." (Markman Order, at 29:23-27, *citing*, *Elkay Mfg. Co. v. Ebco Mfg. Co.*, 192 F.3d 973, 977 (Fed. Cir. 1999) and *Abtox, Inc. v. Exitron Corp.*, 122 F.3d 1019, 1023 (Fed. Cir. 1997)). Had the patentees intended to limit the transmission system to a single location, they would have used a closed transitional term, such as "consisting of," or they would have specified in the claim that they intended to limit the transmission system to a single location by stating, for instance: "a transmission system at a *single* first location." The patentees did not use such language in the claims.

3. Figures 1a, 1b, 1d, 1e, 1f, and 1g of the '702 Patent do not Illustrate a Transmission System at a Single Location

In its Markman Order, the Court states that "Figures 1a, 1b, 1d, 1e, 1f, and 1g of the '702 patent illustrate a transmission system at a single location." (Markman Order, at 30:10-12; Exhibit 1). Based on this statement, the Court held that the specification supports construing the phrase "a transmission system at a first location" to mean a transmission system at a single location and that the specification does not rebut this construction. (Markman Order, at 30:9-14; Exhibit 1).

Figures in a patent are only understood in the context of the language of the specification that refers to them. *See, e.g., Electro Scientific Indus., Inc. v. Dynamic Details, Inc.*, 307 F.3d 1343, 1349 (Fed. Cir. 2002) ("In the context of the entire specification, the depiction of separate work pieces in Figure 6 does not limit the claim language). Stated differently, you read the text of the specification to learn what the Figures mean, not vice-versa. The Court's statement that "Figures 1a, 1b, 1d, 1e, 1f and 1g of the '702 patent illustrate a transmission system at a single location" is apparently based upon the use of a single circle or a single rectangle in each identified figure to denote the transmission system. However, it is not relevant whether, in the figures, the transmission system is denoted in one or more rectangles or circles. The legally relevant question is the following: what does the specification explain is depicted by that single circle or single rectangle in each figure?

In each of Figures 1a, 1b, 1d, 1e, 1f, and 1g, the transmission system is identified by reference numeral 100. Reference numeral 100 is used throughout the specification and the other figures of the patent to identify the transmission system. The specification expressly defines the

transmission system, identified as reference numeral 100, as being located in one facility or spread over a plurality of facilities: "*Transmission system 100* may either be located in one facility or may be spread over a plurality of facilities." ('702 patent, 5:58-60; Exhibit 3; emphasis added). Thus, the transmission systems shown in Figures 1a, 1b, 1d, 1e, 1f, and 1g and identified by reference numeral 100 depict transmission systems that are located in one facility or are spread over a plurality of facilities. These Figures therefore do not support limiting the phrase "transmission system at a first location" to a transmission system at a single location. *Electro Scientific*, 307 F.3d at 1349.

Even if these Figures did depict the transmission system at a single location, which they clearly do not for the reasons we have explained, these Figures alone cannot limit the claim to a transmission system at a single location. *See, Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc.*, 340 F.3d 1298, 1306-07 (Fed. Cir. 2003) ("Similarly, the mere fact that the patent drawings depict a particular embodiment of the patent does not operate to limit the claims to that specific configuration.")

4. The Term "At" Does Not Limit the Phrase "Transmission System at a First Location" to a Single Location

In its Markman Order, the Court stated that the term "at" in the phrase "at a first location" is used to indicate presence or position, and thus this term limits the phrase "transmission system at a first location" to a transmission system at a single location. (Markman Order, at 30:1-9; Exhibit 1).

The use of the preposition "at" in the phrase "at a first location" does not require that the "transmission system" be limited to a single location, because the preposition "at" is not used in the patent specification and in other claims in the Yurt family of patents to indicate presence or position at only a single location. Instead, the term "at" is used in the specification of the patent and in other claims to mean presence or position at *multiple* locations:

> "It is possible to process orders and operate a database of available titles ***at*** *multiple locations* remote of the source material library 111." ('702 patent, 14:43-45; Exhibit 3) (emphasis added).

Further, the term "at" is used in other claims of the Yurt family of patents to indicate presence or position at more than one location.[3] *See, Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *28 ("Because claim terms are normally used consistently throughout the patent, the usage of one term in one claim can often illuminate the meaning of the same term in other claims."); *Inverness Med. Switz. Gmbh v. Princeton Biomeditech Corp.*, 309 F.3d 1365, 1371 (Fed. Cir., 2002) ("A claim term used in multiple claims should be construed consistently").

The patentees' use of the term "at" in the specification and in other related claims should be dispositive that the term "at" does not limit the phrase "transmission system at a first location" to a transmission system at a single location. *See*, *Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS at *29, *quoting, Vitronics Corp. v. Conceptronic, Inc.*, 90 F.3d 1576, 1582 (Fed. Cir. 1996) ("As we stated in *Vitronics*, the specification 'is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.'")

[3] *See*, Claims 19 and 47 of the '992 patent and claims 2 and 5 of U.S. Patent No. 5,253,275 (the '275 patent: Exhibit 5):

"19. A distribution method responsive to requests from a user identifying items in a transmission system containing information to be sent from the transmission system to receiving systems ***at*** *remote locations*, the method comprising the steps of . . ." ('992 patent, Claim 19; Exhibit 2);

"47. A distribution system including a transmission system and a plurality of receiving systems at remote locations, the transmission system being responsive to requests identifying items containing information to be sent from the transmission system to the receiving systems ***at*** *the remote locations*, the distribution system comprising: . . ." ('992 patent, Claim 47);

"2. A distribution method responsive to requests from a user identifying items in a transmission system containing information to be sent from the transmission system to receiving systems ***at*** *remote locations*, the method comprising the steps of: . . ." ('275 patent, Claim 2); and

"5. A distribution method responsive to requests from a user identifying items in a transmission system containing information to be sent from the transmission system to receiving systems ***at*** *remote locations*, the method comprising the steps of: . . ." ('275 patent, Claim 5).

5. The Court Should Construe the Article "A" in the Phrase "at a First Location" to Mean "One or More than One"

In its Markman Order, the Court correctly states that the "articles 'a'[4] or 'an' may mean 'one or more than one' in particular instances, especially in claims that use the transitional term 'comprising.'" (Markman Order, at 29:23-27; Exhibit 1), *citing*, *Elkay*, 192 F.3d at 977 and *Abtox*, 122 F.3d at 1023. Although the claims of the '702 patent use the open-ended transitional term "comprising," the Court does not construe the article "a" in the phrase "at a first location" to mean "one or more than one." The Court did not explain why it did not construe "a" to mean "one or more than one."

The fact that the claims of the '702 patent use the open-ended transition phrase "comprising" "signals that the *entire claim* is presumptively open-ended." *Gillette*, 405 F.3d at 1372 (emphasis added). Therefore, the Court should construe the article "a" in the phrase "at a first location" to mean "one or more than one." The fact that the term "a" follows the term "at" is irrelevant. As discussed above, the term "at" does not limit the phrase "transmission system at a first location" to a transmission system at a single location. Instead, the term "at" was used in the patent specification and in other claims to indicate presence or position at multiple locations.

Thus, the phrase "at a first location" should be construed as "at one or more than one location." This construction is consistent with the definition given by the patentees in the patent specification that the transmission system may be located at one facility or spread over a plurality of facilities. ('702 patent, 5:58-60; Exhibit 3). It is also consistent with the construction of the term "transmission system," which, as discussed earlier, is construed to permit the "transmission system" to be located in one facility or spread over a plurality of facilities, and therefore conforms to the rule that a claim term used in multiple claims should be construed consistently. *See*, *Inverness*, 309 F.3d at 1371; *Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *28.

[4] There is a typographical error in the Markman Order: ". . . articles '*an*' or 'an' may mean . . ." Acacia proposes that the Court correct this typographical error in its reconsidered Markman Order.

6. The Terms "First Location" and "Second Location" Are Repeated Instances of the Same Element

In its Markman Order, the Court rejected Acacia's assertion that the use of the terms "first" and "second" is a common patent law convention to distinguish between repeated instances of an element or limitation. (Markman Order, at page 30, n 21; Exhibit 1). In rejecting Acacia's assertion, the Court merely states that it "does not consider the use of the phrases 'at a first location' and 'at a second location' to qualify as repeated instances of an element or limitation."

Recently, the Federal Circuit held that the terms "first," "second," and "third," (referring to razor blades) used in a claim having the open-ended transition phrase "comprising" could not be construed as limiting the claim to three blades. *Gillette*, 405 F.3d at 1373. In *Gillette*, the court held that the fact that the claim "does not follow a consecutive order (i.e., it does not discuss the second blade after the first)" means that "the claim is thus clearly not using the ordinals-first, second, and third-to show a consecutive numerical limit but only to distinguish or identify the various members of the group." *Gillette*, 405 F.3d at 1373.

The same is true in this case. The claims of the '702 patent do not follow a consecutive order; it is irrelevant whether the transmission system is at the "first location" or the "second location" and likewise whether the reception system is at the "first location" or the "second location;" the only requirement is that the transmission system and the reception system not be at the same location. Clearly then, the terms "first" and "second" are used in the claims of the '702 patent to distinguish between the locations of the transmission system and the reception system," not to provide a numerical limit or serial limitation on the location of the transmission system.[5] *See*, *Gillette,* 405 F.3d at 1373, *citing, 3M Innovative Properties Co. v. Avery Dennison Corp.*, 350 F.3d 1365, 1371 (Fed. Cir. 2003) ("use of the terms 'first' and 'second' is common patent-law convention to distinguish between repeated instances of an element" and should not necessarily be interpreted to impose a serial limitation on a claim.)

[5] Although not explicitly stated by the Court, it appears that the Court construed the term "first" to mean "single," i.e., "at a single [first] location." Based on *Gillette* and *3M*, however, the term "first" should not be construed as a numerical limitation, such as "single."

For all these reasons Acacia respectfully requests the Court to adopt Acacia's proposed reconsidered construction of the phrase "transmission system at a first location."

C. Acacia's Grounds for Reconsideration of the Court's Analysis and Construction of the Claim Phrase "Reception System at a Second Location"

1. Acacia's Proposed, Reconsidered Construction of the Phrase "Reception System at a Second Location"

Acacia respectfully requests that the Court amend its proposed construction of the phrase "Reception System at a Second Location" to reflect the following changes: "A reception system at one or more ~~particular~~ locations separate from the location of the transmission system."

2. The Factual and Legal Arguments Presented in Connection With Reconsideration of the Construction for "Transmission System at a First Location" Apply With Equal Force to the Reconsideration of the Construction for "Reception System at a Second Location"

In its Markman Order, the Court construed the phrase "reception system at a second location" as "a reception system at one particular location separate from the location of the transmission system." (Markman Order, at 31:15-18; Exhibit 1). The Court cited the case of *Andrew Corp. v. Gabriel Elec., Inc.*, 847 F.2d 819 (Fed. Cir. 1988) for the proposition that a patentee may claim less than the entire invention. From this statement, it appears that the Court believed that the invention could encompass reception systems at one or more than one location, but, because the patentees used the terms "at" and "second location," the Court believed the patentee had limited the reception system to a single location, for the same reasons that it did for the transmission system.

For the reasons discussed above with respect to "transmission system at a first location," the Court's construction of reception system is incorrect and the patent specification and claims evidence no such narrowing intent. The entire claim is presumptively open-ended, because the claims use the transitional term "comprising." *Gillette*, 405 F.3d at 1372. Because these are open-

ended claims, the term "a" in the phrase "at a second location" should be construed to mean "one or more than one." The use of the terms "at" and "second" do not affect this construction.[6]

For all these reasons, Acacia respectfully requests the Court to adopt Acacia's reconsidered construction of the phrase "reception system at a second location."

D. Acacia's Grounds for Reconsideration of the Court's Analysis of the Claim Term "Sequence Encoder"

In its Markman Order, the Court held that it could not construe the term "sequence encoder." The Court found that the term "sequence encoder" never appears in the specification of the '702 patent and that the term "sequence encoder" does not have a plain and ordinary meaning. (Markman Order, at 32:4-10; Exhibit 1) The Court also found that one of ordinary skill in the art would not know what a sequence encoder is and would not be able to understand the bounds of the "sequence encoder" claim element, because the term does not appear in the specification of the '702 patent. (Markman Order, at 32:23-24 and 33:12-13; Exhibit 1). The Court held that "the legal consequence of claiming an apparatus which has no plain meaning and which is not defined or referred to in the specification is for the Court to declare the patent claim indefinite." (Markman Order, at 32:11-13; Exhibit 1). The Court also found that the "sequence encoder" of dependent claim 7 of the '702 patent (which adds the limitation that the sequence encoder "transforms digital data blocks into a group of addressable data blocks") is a time encoder that places digital data blocks into a group of addressable data blocks. (Markman Order, at 32:26-33:3; Exhibit 1)

[6] There is an additional error in the Court's analysis of "reception system" that should be corrected. The Court states at 28:17-18 that: "The term 'reception system' does not appear in the specification." This is an incorrect statement, because the term "reception system" does appear numerous times in the specification of the patents. (*See, e.g.,* '702 patent, 3:60-67; 4:7-12; 4:13-17; 4:18-29; 4:30-36; 4:37-42; 4:43-50; 4:51-59; 4:62 - 5:7; 5:8-18; 5:19-29; 5:31-41; 6:39-42; 10:22-24; 11:33-36; 12:51-55; 14:28-31; 14:63-65; 15:14-18; 15:62-64; 16:1-8; 16:13-15; 16:24-33; 16:34-45; 16:55-56; 16:64-66; 17:18-27; 17:33-36; 17:55-57; 18:34-45; 18:49-52; 19:4-10; 19:13-18; Figures 1a, 1b, 1c, 1d, 1e, 1f, and 1g, Reference Nos. 200, 200', 200", and 200"', and Figure 6, Reference No. 200; Exhibit 2). Acacia proposes deleting this sentence from the Markman Order.

1. The Court Applied the Wrong Legal Standard In Construing "Sequence Encoder"

In its Markman Order, the Court held that "the legal consequence of claiming an apparatus which has no plain meaning and which is not defined or referred to in the specification is for the Court to declare the patent claim indefinite." (Markman Order, at 32:11-13; Exhibit 1). The Court's statement of law is directly contradicted by the Federal Circuit's *Bancorp* case. *Bancorp Serv., LLC v. Hartford Life Ins. Co.*, 359 F.3d 1367 (Fed. Cir. 2004). As the court held in *Bancorp*, a patent claim may be definite even though the claim term was not defined or referred to in the specification and even though the claim term has no plain meaning, if the meaning of the term could be inferred by persons of skill in the art from the specification. *Bancorp*, 359 F.3d at 1372-74 (failure to define a claim term in the specification is not fatal "if the meaning of the term is fairly inferable from the patent."); *See also, All Dental Prodx, LLC v. Advantage Dental Products, Inc.*, 309 F.3d 774, 779 (Fed. Cir. 2002), *citing*, *Edelstein v. Frank*, 52 F.3d 1035, 1038 (Fed. Cir. 1995) ("However, the failure of the specification to specifically mention a limitation that later appears in the claims is not a fatal one when one skilled in the art would recognize upon reading the specification that the new language reflects what the specification shows has been invented.")[7]

Further, the Federal Circuit's test for indefiniteness does not require that the claim term at issue have a plain meaning or that it be defined or referred to in the patent specification: "'Determining whether a claim is definite requires an analysis of 'whether one skilled in the art

[7] The Court's statement of law is also directly contradicted by the Manual of Patent Examining Procedure (M.P.E.P.). In the M.P.E.P., patent examiners are instructed that there is no requirement that the words in a claim must match those used in the specification; the only requirement is that the terms used define the invention with a reasonable degree of clarity and precision:

> The mere fact that a term or phrase used in the claim has no antecedent basis in the specification disclosure does not mean, necessarily, that the term or phrase is indefinite. There is no requirement that the words in the claim must match those used in the specification disclosure. Applicants are given a great deal of latitude in how they choose to define their invention so long as the terms and phrases used define the invention with a reasonable degree of clarity and precision.

(M.P.E.P., § 2173.05(e), Seventh Edition, July 1998; Exhibit 6 to Block Decl.).

would understand the bounds of the claim when read in light of the specification . . . If the claims read in light of the specification reasonably apprise those skilled in the art[8] of the scope of the invention, § 112 demands no more.'' *Id.* (citing *Miles Lab., Inc. v. Shandon, Inc*., 997 F.2d 870, 875 (Fed. Cir. 1993))."[9] (Markman Order, at 33:7-11; Exhibit 1).

2. The Court Must Consider Expert Testimony When Determining the Meaning of "Sequence Encoder"

In its Markman Order, the Court states that expert testimony may not be useful in construing "sequence encoder," because the term "sequence encoder" does not appear in the patent specification and because "the intrinsic evidence appears unambiguous." (Markman Order, at 33:21 – 34:3; Exhibit 1). The Court has invited expert testimony on this issue, presumably to revisit and reexamine this entire issue.

By considering expert testimony, the Court avoids potentially reversible error if it were to definitively rule on claim construction or indefiniteness based solely on the intrinsic record. *Verve, LLC v. Crane Cams, Inc.*, 311 F.3d 1116, 1119-1120 (Fed. Cir. 2002);[10] *See also AFG Indus., Inc. v.*

---

[8] In its Markman Order, the Court also states that "Acacia cannot suggest that the *general public* is on notice of the scope of the term 'sequence encoder' as the term never appears in the specification." (Markman Order, at 33:19-21; Exhibit 1 to Block Decl.; emphasis added). Whether the "general public" is on notice of the scope of "sequence encoder" is irrelevant, because patents are written for persons of ordinary skill in the art, not the general public. *W.L. Gore & Associates, Inc. v. Garlock, Inc*., 721 F.2d 1540, 1556 (Fed. Cir. 1983) ("Patents, however, are written to enable those skilled in the art to practice the invention, not the public.")

[9] Further, a claim is not indefinite merely because it poses a difficult issue of claim construction. *Bancorp*, 359 F.3d at 1372; *S3, Inc. v. nVidia Corp*., 259 F.3d 1364, 1369 (Fed. Cir. 2001). If, in light of a fully developed record, the claim is amenable to construction, i.e., it is not insolubly ambiguous, it is not invalid for indefiniteness. *Bancorp*, 359 F.3d at 1372. Thus, if the meaning of the claim is discernible, "even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds." *Id.*, (quoting, *Exxon Research & Eng'g Co. v. United States*, 265 F.3d 1371, 1375 (Fed. Cir. 2001)). Courts are also instructed, in considering whether a claim is indefinite, to respect the statutory presumption of patent validity and "protect the inventive contribution of patentees, even when the drafting of their patents has been less than ideal." *Id.* "Close questions of indefiniteness in litigation involving issued patents are properly resolved in favor of the patentee." *Bancorp*, 359 F.3d at 1372, (quoting, *Exxon*, 265 F.3d at 1380).

[10] In *Verve*, the Federal Circuit vacated a summary judgment of indefiniteness, which was based solely on the intrinsic record, and remanded for "further proceedings, including any appropriate recourse to extrinsic evidence concerning the usage and understanding of the [disputed] term . . . in relevant context." *Verve*, at 1120. The Federal Circuit reasoned that: "[T]he court erred

Cardinal IG Co., 239 F.3d 1239, 1248-49 (Fed. Cir. 2001) (vacating summary judgment that was based on district court's erroneous claim construction: "This case presents a good example of how extrinsic evidence can and should be used to inform a court's claim construction, and how failure to take into account the testimony of persons of ordinary skill in the art may constitute reversible error. . . ."); *Key Pharms. v. Hercon Labs. Corp.*, 161 F.3d 709, 716-18 (Fed. Cir. 1998) ("[A] trial court is quite correct in hearing and relying on expert testimony on an ultimate claim construction question in cases in which the intrinsic evidence . . . does not answer the question. . . ."). Acacia will be providing expert testimony to the Court on this subject, and it is confident the Court will better understand why the term "sequence encoder" is not indefinite.

3. The '702 Patent Specification and its Claims Teach Persons of Ordinary Skill in the Art that the Sequence Encoder is a Time Encoder

In determining the meaning of the term "sequence encoder," the Court must examine the specification of the patent and its claims. *See, Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *25-28. Here, the specification and the claims of the '702 patent teach persons of ordinary skill in the art that the "sequence encoder," as used in claims 1, 17, 18, and 32, is a time encoder.[11]

The patent specification teaches one of ordinary skill in the art that the "sequence encoder" is a time encoder:

> The transmission system 100 of the present invention also preferably includes ordering means for placing the formatted information into a *sequence* of

---

in law, in requiring that the intrinsic evidence of the specification and prosecution history is the sole source of meaning of words that are used in a technologic context. . . . The question is not whether the [disputed term] has a fixed meaning …, but how the phrase would be understood by persons experienced in[the] field …, upon reading the patent documents." *Id.* at 1119-1120.

[11] At the evidentiary hearing on September 8 and 9, Acacia shall present the expert testimony of Mr. S. Merrill Weiss and Dr. Peter Alexander, both of whom (from the perspectives of different education and experience in the same relevant art, both of whom are competent to testify on this precise issue) will testify that, based on the teachings of the specification and based on the knowledge and understanding of one of ordinary skill in the art, such a person would have understood the meaning of "sequence encoder" in January 1991 to be a time encoder. The substance of Mr. Weiss' and Dr. Alexander's testimony is substantially contained in their declarations which Acacia filed on October 20, 2004 in the Central District of California litigation in connection with Acacia's opposition to defendants' motion for summary judgment.

> addressable data blocks. As shown in FIG. 2a, the ordering means in the preferred embodiment includes *time encoder 114*. . . . The *sequence* of addressable data blocks which was time encoded and output by *time encoder 114* is preferably sent to precompression processor 115."[12]

('702 patent, at 7:50-54; 8:46-49; emphasis added).

Thus, one of ordinary skill in the art, when reading the claims in light of the patent specification, would understand the term "sequence encoder" to be a "time encoder." *See, Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *24 ("Importantly, the person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification.")

That the "sequence encoder" of claim 1 is understood to be a time encoder is confirmed by the presence of dependent claim 7.[13] "Under the doctrine of claim differentiation, 'each claim in a patent is presumptively different in scope.'" *See, Ecolab, Inc. v. Paraclipse, Inc.*, 285 F.3d 1362, 1375 (Fed. Cir. 2002), *quoting, Intermatic, Inc. v. Lamson & Sessions Co.*, 273 F.3d 1355, 1364 (Fed. Cir. 2001).

Claim 1 identifies a "sequence encoder," but does not describe in the claim any function of the "sequence encoder." Claim 7 depends from claim 1 and adds the functional limitation that the "sequence encoder transforms digital data blocks into a group of addressable data blocks." The functional limitation of claim 7 further defines a particular capability of the sequence encoder, which is not expressly described in claim 1.[14] Other functions of the sequence encoder (time

---

[12] Further evidence that the "sequence encoder" refers to the time encoder is found in claim 17 of the '702 patent. *See, Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *28 ("Because claim terms are normally used consistently throughout the patent, the usage of one term in one claim can often illuminate the meaning of the same term in other claims.") In claim 17, the sequence encoder is "in data communication with said digital data output [of the converter]." ('702 patent, 20:50-51). As shown in Figure 2a of the '702 patent, the time encoder 114 is in data communication with the converter 113.

[13] Claim 7 of the '702 patent depends from claim 1 and adds the limitation that "said sequence encoder transforms digital data blocks into a group of addressable data blocks." Claim 33 of the '702 patent depends from claim 32, which depends from claim 27, and adds the same limitation.

[14] Functional limitations are permitted, as described in M.P.E.P. § 2173.05(g):

encoder) than that single function described in claim 7 are clearly described in the patent specification. These include, among others, receipt of audio and video data from the converter, '702 patent at 8;6-9; the assignment of relative time markers by the time encoder to the audio and video data as it passes from the converter through the time encoder, Id.; and delivery of a sequence of addressable data blocks as its output to the precompression processor, '702 patent, Col. 8:46-48. As will be fully explained through expert testimony, the patent specification adequately informs one of ordinary skill in the art concerning the meaning of the term "sequence encoder."

4. The Court's Finding that the "Sequence Encoder" In Claim 7 is a Time Encoder Which Transforms Digital Data Blocks Into a Group of Addressable Data Blocks Confirms that "Sequence Encoder" in Claim 1 is a "Time Encoder"

In its Markman Order, the Court understood that the term "sequence encoder" of claim 7 is a "time encoder" which performs the additional functions set forth in claim 7 of transforming digital data blocks into a group of addressable data blocks:

> A *time encoder*[15] that is described in dependent claim 7 of the '702 patent is a limitation describing an additional function of the sequence encoder but does

---

> "A functional limitation is an attempt to define something by what it does, rather than by what it is (e.g., as evidenced by its specific structure or specific ingredients). There is nothing inherently wrong with defining some part of an invention in functional terms. Functional language does not, in and of itself, render a claim improper. *In re Swinehart*, 439 F.2d 210, 169 USPQ 226 (CCPA 1971).
>
> A functional limitation must be evaluated and considered, just like any other limitation of the claim, for what it fairly conveys to a person of ordinary skill in the pertinent art in the context in which it is used. A functional limitation is often used in association with an element, ingredient, or step of a process to define a particular capability or purpose that is served by the recited element, ingredient or step."

(M.P.E.P., § 2173.05(g), Seventh Edition, July 1998; Exhibit 6 to Block Decl.).

[15] The Court obviously had no difficulty determining that the "sequence encoder" is a "time encoder" that performs the functions of claim 7. In fact, the adult internet defendants who argued the original Markman proceedings instructed the Court that claim 7 should be construed as a time encoder that performs the algorithm of a time encoder. (*See* Defendants' Responsive Claim Construction Brief re '702 Patent at 18:4-6; Exhibit 7 to Block Decl.)

> not assist one skilled in the art with defining the boundaries of the claimed element, "a sequence encoder."

(Markman Order, at 32:26 – 33:3; emphasis added).

Although the Court correctly found that the "sequence encoder" of claim 7 is a time encoder with the additional functional limitation of transforming digital data blocks into a group of addressable data blocks, the Court stated that claim 7 does not assist one skilled in the art with defining the boundaries of the "sequence encoder."[16] This is not the case, as will be demonstrated by expert testimony. If the "sequence encoder" of claim 7 is understood to be a time encoder with the additional function of transforming digital data blocks into a group of addressable data blocks, as indicated by the Court in its Markman Order, then, pursuant to the doctrine of claim differentiation, the sequence encoder of claim 1 must be broader, i.e., a time encoder that is not limited to this function. *See Ecolab*, 285 F.3d at 1375; *Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *60-61.[17] As described above, the patent specification teaches a number of functions of the sequence encoder (time encoder) beyond the single function identified in claim 7. ('702 patent, at 7:54-8:12; 8:47-49).

---

[16] To the extent that the Court believes that there remains any ambiguity in construing "sequence encoder," the Court should apply the doctrine that "claims should be so construed, if possible, as to sustain their validity." *Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *64-65, *quoting*, *Liebel-Flarsheim Co. v. Medrad, Inc.*, 358 F.3d 898, 911 (Fed. Cir. 2004), and *Rhine v. Casio, Inc.*, 183 F.3d 1342, 1345 (Fed. Cir. 1999). In this case, it is reasonable to infer that the PTO would not have issued an invalid patent. *Phillips*, __ F.3d at __, 2005 U.S. App. LEXIS 13954, at *66. In allowing claims 1 and 7 of the '702 patent, the Examiner focused on the term "sequence encoder." The Patent Examiner refused to allow original claim 33 (corresponding to claim 1 of the '702) without the "sequence encoder," but agreed to allow original dependent claims 39 and 40 if they were rewritten in independent form. Claim 39 added the sequence encoder to claim 33. Claim 40 added to claim 39 that the sequence encoder transformed digital data blocks into a group of addressable data blocks.

The Examiner is presumed to have followed M.P.E.P. § 608.01(o), which instructs examiners to scrutinize patent claims for claim terms that are not recited in the specification and to ensure that such terms are supported by the specification and are capable of being construed. (M.P.E.P., § 608.01(o), Seventh Edition, July 1998; Exhibit 6 to Block Decl.).

[17] It appears that the Court reached this decision based on its belief that the time encoder in all instances (including claim 1) must only transform digital data blocks into a group of addressable data blocks. There is, however, nothing in the patent specification or in the claims which states or implies that, in order to qualify as a time encoder, the time encoder must only transform digital data blocks into a group of addressable data blocks.

5. Acacia's Proposed, Reconsidered Construction of "Sequence Encoder"

Acacia contends that the proper construction of the phrase "sequence encoder," as used in claims 1, 17, 18, and 32 of the '702 patent, should be:

"a time encoder."

Acacia further contends that the proper construction of the phrase "sequence encoder" in claims 7 and 33 of the '702 patent, should be:

"a time encoder that transforms digital data blocks into a group of addressable data blocks."

E. Acacia's Grounds for Clarification of the Court's Analysis of the Claim Term "Identification Encoder"

In its Markman Order, the Court construed the term "identification encoder" to mean "a structure that assigns a unique identification code." (Markman Order, at 35:24 – 36:1; Exhibit 1). Although the Court was able to construe this term, the Court stated that the "identification encoder" was "insolubly ambiguous" and "arguably indefinite." (Markman Order, at 35:22, 23; Exhibit 1).

Acacia does not seek reconsideration of the Court's construction of "identification encoder." Instead, Acacia seeks clarification of the Court's aforementioned statements in the Markman Order. In addition, because the Court invited Acacia to present expert testimony in the Markman Order, Acacia will present expert testimony at the evidentiary hearing on September 8 and 9 regarding the understanding of persons of ordinary skill in the art as to the meaning of "identification encoder" when the claims are read in light of the specification.

1. The Court Should Clarify Its Markman Order to State that the Specification of the '702 Patent States that the Identification Encoder Includes Software

In its discussion of the "identification encoding means," the Court states that "[o]ther than the term itself, the specification contains no description of the structure of an 'identification encoder.' It is unclear whether it is hardware, software, or as claimed with another element, a human being." (Markman Order, at 19:9-11; Exhibit 1). The Court also states that "[h]ere, the specification of the '702 patent only discloses an identification encoder as a box that performs the

function of assigning a unique identification code. ('702 patent, 6:30-39; Exhibit 3). The specification does not disclose an algorithm, software, or apparatus to perform the function of assigning a unique identification code." (Markman Order, at 35:17-20). Certain of these statements are factually incorrect for the reasons set forth below.

Figure 2A of the '702 patent depicts the identification encoder with reference numeral 112 and the specification states that reference numeral 112 is the identification encoder (See, e.g., '702 patent, 6:31-42; Exhibit 3). In Figure 2A, the identification encoder 112 is designated as the "identification encoding *process.*" Acacia will present expert testimony at the evidentiary hearing showing that the term "process" as used in the patent documents would have been understood in January 1991 to a person of ordinary skill in the art to refer to the execution of a computer program. Thus, the '702 patent does describe the structure of the identification encoder as including software.

Further, the Court construed the term "transmission system" to mean "an assembly of elements, *hardware and software*, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system." (Markman Order at 28:12-14). Thus, as claimed, the "identification encoder" is part of the transmission system, and therefore is one element of the assembly of elements (hardware and software) which comprise the transmission system. At the evidentiary hearing Acacia's experts will explain why this disclosure is sufficiently definite to one of ordinary skill in the art.

2. The Court Should Clarify its Markman Order to Remove the Statements that the term "Identification Encoder" is "Insolubly Ambiguous" and "Arguably Indefinite"

Although the Court construed the term "identification encoder," the Court also stated that the term was "insolubly ambiguous" and "arguably indefinite."[18] (Markman Order, at 35:22, 23).

[18] The fact that the Court's construction of "identification encoder" may be broad is not a ground for finding the term "identification encoder" to be indefinite. The breadth of a claim term is not equated with indefiniteness. *SmithKline Beecham Corp. v. Apotex Corp.*, 403 F.3d 1331, 1340-1341 (Fed. Cir. 2005), *quoting, In re Gardner*, 427 F.2d 786, 788 (C.C.P.A. 1970) ("The test for indefiniteness does not depend on a potential infringer's ability to ascertain the nature of its own accused product to determine infringement, but instead on whether the claim delineates to a skilled artisan the bounds of the invention. . . . 'breadth is not indefiniteness.'"); *See also* M.P.E.P.

Additionally, in footnote 26 on page 35, the Court stated that it "considers the term 'identification encoder' to be indefinite consist [sic] with the Court's analysis of the term "identification encoding means."[19]

These statements contradict the fact that the Court construed the term "identification encoder." These statements therefore do not belong in the Markman Order.

F. Acacia's Grounds for Clarification of the Court's Construction of the Claim Phrase "in Data Communication with"

In its Markman Order, the Court construed the phrase "in data communication with" as "one or more devices connected such that data is being transferred between the devices in real-time." (Markman Order, at 29:19-20; Exhibit 1). The Court based this construction on its belief that "[t]he plain and ordinary meaning to one of ordinary skill in the art of the phrase 'in data communication with' is 'one or more devices connected such that data is being transferred between the devices in real-time.'" (Markman Order, at 29:9-11; Exhibit 1). This meaning for "in data communication with" is not found in the specification of the patent or in the *IEEE Dictionary* cited by the Court. There also was no expert testimony to support a finding that this is the plain and ordinary meaning to a person of ordinary skill in the art. The Court further explained that the meaning of "in data communication with" excludes transferring a diskette: "transferring a diskette from one computer to another would not make the two computers 'in data communication with' one another." (Markman Order, at page 23, n 17; Exhibit 1).

---

§ 2173.04, Seventh Edition, July 1998 ("Breadth of a claim is not to be equated with indefiniteness. [citation omitted]. If the scope of the subject matter embraced by the claims is clear, and if applicants have not otherwise indicated that they intend the invention to be of a scope different from that defined in the claims, then the claims comply with 35 U.S.C. 112, second paragraph) (Exhibit 6 to Block Decl.)

[19] The statement that the Court considers the term "identification encoder" to be indefinite consistent with the Court's analysis of the term "identification encoding means" is a legal non-sequitur and should be eliminated. The analysis of definiteness for a term such as "identification encoding means" which is construed under 35 U.S.C. § 112, ¶ 6, is very different than the analysis for definiteness of a term such as "identification encoder." The Court expressly held that "identification encoder" was not to be construed under 35 U.S.C. § 112, ¶ 6. (Markman Order, at 35:4-5; Exhibit 1).

Acacia seeks clarification of the Court's construction of "in data communication with" in two respects. First, the Court's construction of "in data communication with" refers to "*one* or more devices." The Court obviously did not mean "one or more devices," because one device cannot be in data communication with itself. Acacia proposes modifying the construction of "in data communication with" to refer to "two or more devices."

The second issue to be clarified within the Court's construction of "in data communication with" refers to the data being transferred in "real-time." Acacia recognizes from the Markman Order that the "real-time" limitation adopted by the Court in its construction was intended to exclude the transfer of data by diskette, and Acacia does not seek to disturb the Courts intended result on that issue. Unfortunately, the use by the Court of the term "real-time" to accomplish that objective creates a new and separate claim construction problem. The term "real-time" is used in the patent specification differently than it is apparently being used by the Court in its construction. The Court is apparently using the term "real-time" to refer to the time for the data to be transferred. In the patent, however, the term "real time" is used to indicate the amount of time necessary to view a video program. Therefore, as described in the patent, the transmission of a video program can occur in a *fraction* of real time, i.e., the time to send the video is less than the time to watch the video program (for example, a two-hour movie can be transmitted in one hour):

> A still further object of the present invention is to provide a picture and sound transmission system wherein the selected audio/video material is sent over any one of several existing communications channels *in a fraction of real time* to any location chosen by the user that has a specified receiver

('992 patent, 1:67 – 2:4; Exhibit 2).

Acacia is concerned that the different possible meanings for "real-time" could cause juror confusion. If "real-time" in the Court's construction were misunderstood to mean the time necessary to view a video program, then the construction of "in data communication with" would be unduly limited to only instances where the data is transferred at the same rate as necessary to view

the video program. Acacia does not understand that it was the Court's intent to so limit its construction of the phrase "in data communication with."

1. Acacia's Proposed Clarified Construction of "in Data Communication With"

Acacia proposes that the Court clarify its construction of "in data communication with" by modifying the construction to state as follows:

> "two or more devices connected while data is being transferred between the devices."

III. CONCLUSION

For the foregoing reasons, Acacia respectfully requests that the Court reconsider its Markman Order constructions and that the Court adopt Acacia's modified constructions.

NO. C 05-01114

FURTHER CLAIM CONSTRUCTION ORDER ; ORDER FINDING CLAIMS TERMS INDEFINITE AND CLAIMS INVALID

I. BACKGROUND

In its July 12, 2004 Claim Construction Order, the Court reached a tentative conclusion that the term "sequence encoder" as used in claims 1, 7, 17, 18, 32 and 33 of the '702 patent is indefinite. This tentative conclusion of indefiniteness was based on the Court's findings from the intrinsic evidence that the term: (a) is never used in the written description; (b) does not appear in the drawings; (c) has no plain meaning, and (d) cannot be inferred to be a "time encoder," since a time encoder could be described in a dependent claim as a limitation of a sequence encoder.

In its July 12, Order, the Court also tentatively concluded that, based on the intrinsic evidence, the term "identification encoder," as used in claims 1, 5, 6, 17, 19, 27 and 31 of the '702 patent may be insolubly ambiguous because the term: (a) has no plain meaning; (b) is not defined in terms of what the apparatus is but rather how it functions; and (c) has no meaning to one of ordinary skill in the art, such that this person would understand the scope and bounds of the claim, when read in light of the specification. The Court, nevertheless, construed the claim term "identification encoder" in the '702 patent to mean "a structure that assigns a unique identification code."

The Court invited the parties to address the Court's concerns and specifically invited Plaintiff Acacia to present any extrinsic evidence on what a person of ordinary skill in the relevant art would understand the terms to mean when read in light of the patent specification.

While that invitation was outstanding, the case was placed under multi-district assignment. The Court invited all parties to submit briefs on any of the claim terms which the Court had construed. The Court reiterated its offer to Acacia to allow presentation of extrinsic evidence pertinent to the two terms tentatively found indefinite. The parties submitted briefs and declarations by proffered experts: Andrew B. Lippman and S. Merrill Weiss. On September 8 and 9, 2005, the Court conducted a hearing and the matter submitted for decision. This Order addresses the claim construction issues tendered to the Court.

II. STANDARDS

Claim construction is purely a matter of law, to be decided exclusively by the Court. Markman v. Westview Instruments, Inc., 517 U.S. 370, 387 (1996). Claims are construed from the perspective of a person of ordinary skill in the art at the time of the invention. Markman v. Westview Instruments, Inc., 52 F.3d 967, 986 (Fed. Cir. 1995). To determine the meaning of the claim terms, the Court initially must look to intrinsic evidence, that is, the claims, the specification, and, if in evidence, the prosecution history. Autogiro v. United States, 384 F.2d 391 (Ct. Cl. 1967). The Court must look first to the words of the claims themselves. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). These words are to be given their ordinary and customary meaning unless it is clear from the specification and prosecution history that the inventor used the term with a different meaning. Id. The claims should be

interpreted consistently with the specification. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998).

Where intrinsic evidence alone resolves any ambiguity in a disputed claim term, it is improper to rely on evidence which is external to the patent and file history. Vitronics, 90 F.3d at 1583, 1585. However, extrinsic evidence may be considered in the rare instances where the intrinsic evidence is insufficient to enable the court to construe disputed claim terms. Id. at 1585. Common sources of extrinsic evidence include expert testimony, inventor testimony, dictionaries, and technical treatises and articles. Id. at 1584.

III. DEFINITIONS CONFIRMED

The Court reaffirms its July 12, 2004, Order and lets stand its definitions of the following terms, with any modifications noted:

1. Transmission system

The Court lets stand its previous definition of "transmission system" to mean an assembly of elements, hardware and software, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system.

2. Transmission system at a first location

The Court lets stand its previous definition of "transmission system at a first location" to mean a transmission system at one particular location separate from the location of the reception system.

3. Reception system at a second location

The Court lets stand its previous definition of "reception system at a second location" to mean a reception system at one particular location separate from the location of the transmission system.

4. In data communication with

The Court lets stand its previous definition of "in data communication with" to mean two or more devices connected such that data is being transferred between the devices in real time. During the September hearing, questions arose as to the meaning of "in real time" after the previous order was issued. The Court defines "in real time" to mean that the receiving system receives the data in the same electronic time frame as the transmission system sends the data.

5. Remote locations

"Remote locations" was defined in the previous order as part of the '992 patent claim construction. The Court includes the construction for the '992 patent in the '702 patent claim construction with its justification outlined in the previous order. The term "remote locations" means positions or sites distant in space from some identified place or places.

6. Transceiver

The Court lets stand its previous definition of "transceiver" to mean a singular device capable of both sending and receiving information.

IV. CLAIM TERMS TENTATIVELY FOUND INDEFINITE

The Court now addresses the terms which it tentatively concluded were indefinite.

A. The statutory requirement of definiteness.

Every patent's specification must "conclude with one or more claims particularly point out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, ¶ 2. This requirement is commonly referred to as the "definiteness" requirement.

As the United States Supreme Court explained in General Electric Company v. Wabash Appliance Corporation, 304 U.S. 364, 369 (1938):

> Patents, whether basic or for improvements must comply accurately and precisely with the statutory requirements as to claims of invention or discovery. The limits of a patent must be known for the protection of the patentee, the encouragement of the inventive genius of others and the assurance that the subject of the patent will be dedicated to the public. The statute seeks to guard against unreasonable advantages to the patentee and disadvantages to others arising from uncertainty as to their rights. The inventor must inform the public during the life of the patent of the limits of the monopoly asserted, so that it may be known which features may be safely used or manufactured without a license and which may not. The claims measure the invention. . . . In a limited field the variant must be clearly defined.

A patent claim which fails to meet the definiteness requirement is invalid. Id., See also United Carbon Company v. Binney Company, 317 U.S. 228, 232 (1942); Default Proof Credit Card System, Inc. v. Home Depot, 412 F.3d 1291, 1302-1303 (Fed. Cir. 2005).

B. The question whether a patent claim meets the definiteness requirement is a question of law for the Court.

A determination as to whether a patent claim meets the definiteness requirement is a question of law to be decided by the court in performance of its duty as the construer of patent claims. Bancorp Services, L.L.C. v. Hartford Life Insurance Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004).

An issued patent is entitled to a statutory presumption of validity. 35 U.S.C. § 282. A patent claim is indefinite only if, under these canons of construction, the court finds that one skilled in the art would not understand what is claimed when the claim is read in light of the specification. Personalized Media Communications, Inc. v. Int'l Trade Comm'n, 161 F.3d 696, 705 (Fed. Cir. 1968). If the Court is able to determine a reasonable, unambiguous meaning of the terms of a claim, as those terms would be understood by a person of skill in the art in light of the specification, even though the task is formidable and the conclusion is one over which reasonable people disagree, the claim is not indefinite. Bancorp Services, L.L.C., 359 F.3d at 1371; see also Datamize, L.L.C. v. Plumtree Software, Inc., 417 F.3d 1342, 1347-1348 (Fed. Cir. 2005).

A determination of definiteness is made based upon proper interpretation of the meaning of the terms used in the claim, according to the canons of claim construction. Oakley, Inc. v. Sunglass Hut Int'l, 316 F.3d 1331, 1340-41 (Fed. Cir. 2003). Under those canons, interpreting the meaning of the terms begins with a review of the intrinsic evidence–the claims, other parts of the specification, and the prosecution history. Markman v. Westview Instruments, Inc., 517 U.S. 370 (1996); Datamize, L.L.C., 417 F.3d at 1348.

The claim terms are generally given their ordinary and customary meaning. If a technical term is used in a patent claim, generally, the term should be interpreted as having the meaning a person experienced in the field of the invention would give to it. See Verve, L.L.C. v. Crane Cams Inc., 311 F.3d 1116, 1119 (Fed. Cir. 2002). Testimony by a witness, who is recognized by the Court as an expert in the field of the invention, about the common meaning of a technical term at the time the application was filed, is instructive in ascertaining its meaning. See Glaxo Wellcome, Inc. v. Andrx Pharm., Inc., 344 F.3d 1226, 1229 (Fed. Cir. 2003); Optical Discorp v. Del Mar Avionics, 208 F.3d 1324, 1334 (Fed. Cir. 2000).

C. The Claims of the '702 Patent.

Claim 1 of the '702 patent claims:

> 1. A communication system comprising:
> a transmission system at a first location in data communication with a reception system at a second location, wherein said transmission system comprises
> **a sequence encoder**,
> **an identification encoder**, and
> a compressed data library in data communication with **said identification encoder**,
> wherein **said identification encoder** gives items in said compressed data library a unique identification code; and
> wherein said reception system comprises
> a transceiver in data communication with said transmission system,
> a storage device in data communication with said transceiver,
> user playback controls in data communication with said storage device,
> a digital compressor in data communication with said storage device, and
> a playback device in data communication with said digital decompressor.

('702 patent, 19:26-47.)

D. "Sequence encoder."

1. The term "sequence encoder" has no ordinary and customary meaning.

In addition to Claim 1, the term "sequence encoder is also used in Claims 7, 17, 18, 32 and 33 of the '702 patent. In its tentative conclusion, the Court determined that the term "sequence encoder" had no ordinary and customary meaning in the field of the invention.

Initially, Acacia objected to that conclusion.[1] However, at the September 2005, hearing, Acacia tendered Mr. S. Merrill Weiss as an expert witness on how persons of ordinary skill would understand the terms used in the '702 patent claims and specification in 1991.

Mr. Weiss opined that the field of the invention disclosed in the '702 patent was “system design” in the broadcast television industry. (TR. 18:23-25, 19:1-1.) Mr. Weiss opined that he had a sufficient background to express an opinion on the education and experience of a person skilled in that field in 1991. In that regard, Mr. Weiss testified that one skilled in system design in the television broadcast industry was

[1]Acacia contended that an encoder is "a device or system that encodes data." Acacia asserted that a "sequence encoder" is "an encoder which creates a sequence."

one who had a Bachelor of Science degree in electrical engineering, computer science or computer engineering or the equivalent in experience in the broadcast television industry. (TR. 43.)

Specifically, with respect to whether the term "sequence encoder" had an ordinary and customary meaning to one skilled in system design in the television broadcast industry, Mr. Weiss testified:

> Q. In 1991, did the term "sequence encoder" have an ordinary meaning to one of ordinary skill in the art?
>
> A. No.
>
> * * *
>
> Q. In 1991, would the term "sequence encoder" have been a term of art to one of ordinary skill in the art?
>
> A. No.
>
> * * *
>
> Q. Are you aware of any dictionary in 1991 where it would have defined the term "sequence encoder"?
>
> A. No.

(TR. 64-65.)

Accordingly, the Court confirms its tentative finding that the term "sequence encoder" is a technical term which had no ordinary and customary meaning in the field of the invention at the time the patent was filed.

2. "Sequence encoder" is a coined technical term which is not expressly defined.

A patentee is free to act as his or her own lexicographer. Acting as lexicographer, the patentee may either define a term used in a claim differently from its ordinary meaning or coin a new term. However, if the patentee chooses to act as his or her own lexicographer, the special definition must be clearly stated within the patent specification or file history. Vitronics Corp., 90 F.3d at 1582.

Acacia now acknowledges that the term is a "coined term," meaning that the patentee made up the term acting as lexicographer. However, there is no clear statement of definition of the coined term "sequence encoder" in the specification or file history. Indeed, as the Court noted in its July 12 Order, other than in the claims themselves, the term "sequence encoder" is never used in the specification of the '702 patent and was never used or referred to in the prosecution of the '702 patent.

If a patentee uses a coined technical term as an element of a claim and fails to clearly define the term elsewhere in the specification or prosecution history, the meaning of the term is left to speculation and subjective judgment. A patent claim, which includes as an element a term, the meaning of which is left to speculation and subjective judgment, is indefinite.

To avoid an ultimate finding of indefiniteness, Acacia contends that, although the term is not expressly defined in the specification, a person skilled in the art would infer a meaning for the term "sequence encoder" from the description in the specification of other devices. Specifically, Acacia contends that one skilled in the art would infer that by "sequence encoder" the patentee meant "a time encoder."

3. A patent claim is not indefinite if based on the specification, a meaning for an otherwise undefined term can be inferred from the specification.

Acacia directs the Court to two decisions of the Federal Circuit which it asserts as authority for a methodology of defining coined claim terms that have no meaning in the art and are not referred to in the specification: Bancorp Services L.L.C. v. Hartford Life Insurance Co., 359 F.3d 1367 (Fed. Cir. 2004) and Network Commerce, Inc. v. Microsoft Corp., 422 F.3d 1353 (Fed. Cir. 2005).

In Bancorp a patent describes a system for administering and tracking the value of life insurance policies in separate accounts. Bancorp Services, 359 F.3d at 1369. The independent claims used the term "surrender value protected investment credits." Except for use in the claims themselves, the term was not used in the patent. The trial judge found the term to be unclear in meaning as to render the patent claims invalid. Bancorp argued that the challenged term meant the same as "stable value protected investment," a term which was commonly understood in the insurance field and which was used and defined in the specification. Id. at 1370. On appeal the Federal Circuit agreed with Bancorp that based on the specification the terms were equivalent to one another. Id. at 1373. Thus, Bancorp Services stands as authority that the failure to define a term is not fatal if the meaning of the term can be fairly inferred from terms in the specification which were commonly used in the field and which those of skill in the industry regarded as synonymous.

In Network Commerce the term "download component" was used in the claims. Network Commerce, 422 F.3d at 1357. It was found to be a term which had no commonly understood meaning nor

one with a specialized meaning in the field of the invention. However, the Federal Circuit gave a definition to the term based on the specification. The claims stated how the "download component" functioned in the claimed method. The Circuit Court relied on references to "download file" in the specification to define "download component." Id. at 1360-1361.

This Court notes that Network Commerce is not a case where the claim was being reviewed to determine if it met the "definiteness" requirement. The issue in Network Commerce was whether or not the definition of the term should include a "boot program" which interacts with the operating system of the computer. The Circuit held that it did:

> In summary, the specification makes clear that the download component must include a boot program, and that the boot program interacts directly with the operating system of the computer without the assistance of any other program. Accordingly, we construe "download component to mean...

Id.

Acacia is correct, however, that in both cases, the Federal Circuit gave definition to a coined term which was not expressly defined in the specification. However, in both cases, the Federal Circuit relied on the intrinsic language of the patent specification to construe the meaning of the subject terms. The question in this case becomes whether based on the specification of the '702 patent, it can be reasonable inferred that the term "sequence encoder" means "time encoder."

4. A "time encoder" is referred to in the specification.

The term "time encoder" is itself a coined technical term with no ordinary and customary meaning to one skilled in the field of system design at the time the '702 patent was filed. Mr. Weiss, though, testified that in his opinion a “time encoder” was essentially a “time code generator,” which was known at the time of the invention (TR. 173:23-25.)

The Court considered the device called "time encoder" when the Court defined the term "ordering means" in construing the '992 patent. The '702 patent shares the same specification as the '992 patent. With respect to "time encoder," the specification states:

> The transmission system 100 of the present invention also preferably includes ordering means for placing the formatted information into a sequence of addressable data blocks. As shown in FIG. 2a, the ordering

> means in the preferred embodiment includes time encoder 114. After the retrieved information is converted and formatted by the converter 113, **the information may be time encoded by the time encoder 114. Time encoder 114 places the blocks of converted formatted information from converter 113 into a group of addressable blocks.** The preferred addressing scheme employs time encoding. Time encoding allows realignment of the audio and video information in the compressed data formatting section 117 after separate audio and video compression processing by precompression processor 115 and compressor 116."

('702 patent, 7:50-64.)

From this and other references in the specification, the Court finds that the "ordering means" may include a " time encoder" which is a device that can be used in a preferred embodiment of the claimed "transmission system." If a "time encoder" is used as part of the ordering means, its function is to place blocks of converted data into a "group of addressable data blocks." The "time encoder" uses "time encoding" to do so. There is nothing in the specification which discloses that the "time encoder" can encode any sequence other than "time." Thus, to give "sequence encoder" the definition of the "time encoder disclosed in the specification" would limit the "sequence encoder" to encoding "time" as the only sequence it is capable of encoding.

5. There is no suggestion in the specification that "time" is the only "sequence" which could be used to practice the invention.

There is nothing in the specification of the '702 patent which supports the contention that the patentee intended time to be the only encodable sequence.

If a patentee uses a broad undefined term (such as "sequence encoder") in claiming an invention, when the validity of the patent is called into question in a legal proceeding, the owner of the patent cannot avoid invalidity by adopting a more limited definition (such as "time encoder"), unless that limitation can be fairly inferred from the specification.

Mr. Weiss opined that, since the patent is "fundamentally" about audio and video information and since such information is naturally processed and stored using time, a person of ordinary skill in the art would understand "sequence encoder" to be a "time encoder:"

//

Q. Now, if as you said earlier without regard to any part of the patent the term "sequence" can mean any sequence and not necessarily a time sequence, why would a person of ordinary skill in the art understand the term "sequence encoder" to be a time encoder rather than some other encoder in the context of this patent?

A. Because this patent is fundamentally about video and audio processing and storage and handling and the natural way that video and audio are, are – their inherent structure is along a time line. They are naturally divided by – into time.

(TR. 161:2-13.)

However, on cross-examination, Mr. Weiss acknowledged that, based on the specification, time was not the only natural sequence for organizing the type of data covered by the invention:

Q. And so you agree that as of the time of the filing of the patent application in January of 1991 packets of data were organized and in sequences that were unrelated to time?

A. I think you last said they could be and yes they could be.

Q. And they actually were; correct?

A. In some applications they were.

(TR. 210:9-16.)

Later, in his testimony, Mr. Weiss acknowledged that a "time encoder" was only "one example" of the broader term "sequence encoder." (TR. 225:10-14.) He stated his opinion that the terms were synonymous was based on a process of elimination. In other words, since a "time encoder" and an "identification encoder" were the only encoder mentioned in embodiments of the invention, by process of elimination, Mr. Weiss drew the conclusion that the "sequence encoder" meant the "time encoder." Mr. Weiss' testimony went beyond the bounds of his expertise. The Court rejects his methodology.

Furthermore, it is fundamental that while the specification should be consulted to obtain an understanding of a claim, the limitation of a preferred embodiment disclosed in the specification is not to be read into a claim, unless reading the limitation in is required by the language of the claim. As the Federal Circuit observed in Phillips v. AWH Corp., "although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments." 415 F.3d 1303 at 1323 (Fed. Cir. 2005). There are notable exceptions to the rule for not limiting the claim to a preferred embodiment, such as when the preferred embodiment is described in the

specification as the invention itself. In other words, where the patentee describes an embodiment as being the only way of utilizing the invention, it is permissible to limit the claim to the embodiment.

In this case, given the types of materials which can be transmitted in practicing the invention (books, photographs, musical instruments and other items–digitized for transmission) from the specification, there is no basis for the Court to conclude that "time" is the only sequence which one skilled in the art would have used in 1991 to practice the invention.

6. To import into "sequence encoder" the definition "time encoder" as disclosed in the specification would be importing a limitation which the patentee expressly did not import.

Accepting Acacia‹s definition of "sequence encoder" would violate the doctrine of claim construction, called "claim differentiation."[2]

In deciding the scope of a claim, the Court is obliged to consider the other claims in the patent. Howes v. Medial Components, Inc., 814 F2d 638, 643 (Fed. Cir. 1987); Moeller v. Ionetics, Inc., 794 F2d 653, 656 (Fed. Cir. 1986). Under the doctrine of "claim differentiation," the presence of limitations in narrow claims is evidence that these limitations are not to be read into a broader claim. The patentee is entitled both to a narrow claim particularly directed to a preferred embodiment described in the specification and to a broad claim which defines the invention without reference to those details. The presence of the narrow claim negates limiting the broad claim to the preferred embodiment. The presence of a specific limitation in one claim gives special significance to the absence of that specific limitation in another claim, in that it shows that when the limitation was intended it was expressed. Hoganas AB v. Dresser Indus., Inc., 9 F.3d 949, 950 (Fed. Cir. 1993) (quoting E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir.), cert. denied, 488 U.S. 986 (1988); SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1122 (Fed. Cir. 1985).

//

[2]The Court has previously considered and rejected Acacia's argument that "sequence encoder" should be defined as the time encoder disclosed in the specification. The Court reconsiders its ruling in light of the briefs and testimony presented at the September hearing.

In this case, dependent claim 7 reads:

> A communication system as recited in Claim 1**, wherein said sequence encoder transforms digital data blocks into a group of addressable data blocks**.

The Court has construed the apparatus which transforms digital data blocks into a group of addressable data blocks to be the "time encoder," which is part of the ordering means. The same terms should be given the same meaning in all of the claims, unless it is clear from the specification that the terms have different meanings. Fin Control SYS. Pty. v. AM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). Based on their common function, the Court finds that "sequence encoder that transforms digital data blocks into a group of addressable data blocks" in claim 7 is the same device as the one described in the specification as part of the ordering means called the "time encoder," which transforms the data into a "group of addressable blocks," employing "time" as the preferred addressing scheme.

Claim 1 differs from claim 7 it that it does not limit the sequence encoder to one which transforms digital data blocks into a group of addressable data blocks nor is it limited to using time as the preferred addressing scheme. Therefore, claim 1 is broader than the sequence encoder disclosed in claim 7. The sequence encoder in claim 1 could possibly be the ordering means and the structure in claim 7 could possibly be the time encoder.[3] Hence, the Court cannot infer that the "sequence encoder" is a "time encoder" as that term is used in the patent specification.

The Court examined Bancorp Services and Network Commerce to see if those cases involved claim differentiation issues. In those decisions, the Federal Circuit did not address whether an unlimited

---

[3]The "sequence encoder" in claims 7 could be construed to read on the "ordering means" in the written description. This is consistent with the testimony of Mr. Weiss, where he said that other encoding schemes, besides time encoding, may be used in the system (TR. 212:20-24, 224-225.) These other encoding schemes would be necessitated by source library items that contained other than audio/video information, like books or violins. There may also be other functions associated with the ordering means. Mr. Weiss said that he would have known how to build a time encoder, since time encoding techniques were well known in 1991 (TR. 174.) However, it would not have been obvious how to build the "ordering means," since the written description does not fully specify all the functions nor does it teach any structure for the "ordering means" from which such functions could be deduced.

element in an independent claim should be given a definition which would import the sole limitation of a dependent claim. Therefore, those cases are not authority for construing the subject patent.[4]

However, upon reconsideration the Court limits its finding of indefiniteness to the independent claims 1, 17 and dependent claim 32. Dependent claims "shall be presumed valid even though dependent upon an invalid claim." 35 U.S.C. § 282. The Court leaves for later consideration upon motions by the parties whether or not the limitations in dependent claims 7, 18 and 33 provide additional information about "sequence encoder" to allow the Court to define it and to satisfy the definiteness requirement.

7. There is a lack of indication of a cooperative relationship between the "sequence encoder" and the other elements of the claim.

Patents claiming a system, are indefinite under §112 if the claim does not recite structural relationships of essential elements. See In re Collier, 397 F.2d 1003 (C.C.P.A. 1968). If the system is one for which the relationship of elements is conventional and commonly known, the Court can take notice of a relationship, even if one is not stated. However, when the element is not known in the field of invention, the claim must specify the relationship.

Claims 1 and 32 of the '702 patent disclose a communication system, comprising a transmission system and a reception system. The "sequence encoder" is disclosed as an element of the transmission system. Unlike other elements of claims 1 and 32,[5] the term "a sequence encoder" omits disclosure of a cooperative relationship with the other elements. There is no specification of its input or its output. This omission is particularly troublesome because as a coined term which is not defined, there is no way to determine a relationship.

---

[4]The Court also considered Masami Corp. v. Mallinckrodt, Inc., 18 Fed. Appx. 852 (Fed. Cir. 2001), where the court found "adaptive filter" and "adaptive signal processor" to mean an "adaptive noise canceler." The latter term was used interchangeably with the other terms during the prosecution of the patent and in dependent claims. No such interchangeable use is involved in this case.

[5]Claim 7 also lacks an express relationship between the "sequence encoder" and the other elements. The term "in data communication with" is lacking. However, if the "sequence encoder" in Claim 7 is equated with the "time encoder," the specification shows a relationship.

Thus, an additional basis for indefiniteness of claims 1 and 32 is the lack of a disclosed cooperative relationship between the "sequence encoder" and the other elements leaves a gap between essential structural connections.[6]

E. "Identification encoder."

1. The term "identification encoder" is a coined technical term which is ambiguous.

The Court confirms its tentative finding that the term "identification encoder" had no ordinary and customary meaning to one skilled in the art at the time of the invention. Mr. Weiss, Acacia's expert witness on the meaning of the term, testified that "identification encoder" had no ordinary meaning to one skilled in the art. (TR. 64:18-21.)

Since the term has no plain meaning, the Court looks to the patent specification to see if the patentee defined the apparatus. Unlike the "sequence encoder," the written description contains references to "identification encoder." Among others, the written description contains the following references to unrelated preferred functions of the "identification encoder" occurring at various unspecified times in the transmission system:

1. The identification encoder 112 gives a unique identification code to items stored in a compressed data library (6:34-35);
2. Performs storage encoding (giving the item a unique identification code, optionally logging details about the item, called program notes, and assigning the item a popularity code) just prior to conversion of the item for transmission to reception system, at any item after starting the conversion process, or after storing the item in the compressed data library (6:34-42);
3. Preferably assigns: a unique identification code, a file address, a popularity code and input program notes (6:43-48);
4. Inputs digital signal to digital input receiver (6:62-64);

[6]As shown in claims 17 and 18, the patentee was capable of specifying a relationship between the "sequence encoder" and other claim elements if there are any.

5. Inputs analog signal to analog-to-digital converter (7:6-8);

6. Passes previously compressed items directly to the compressed data library (7:36-41);

7. Allows entry of item notes and production credits (10:45-51);

8. Maps item addresses to item names as an alternative method of accessing items (10:52-53);

9. Operates a program which updates a master item database containing facts regarding items in the compressed data library system (10:56-59);

10. Generates a unique address code which makes access to the requested data possible (10:43-44).

As the Court stated in its July 12 Order, although some of the functions of the "identification encoder" are set out, there is no description of a structure which performs those functions. Apparatus claims cover what a device is, not what a device does. See Hewlett Packard Co. v. Bausch & Lomb, Inc., 909 F.2d 1464, 1468 (Fed. Cir. 1990). Figure 2a contains a block diagram designated "112" and labeled "IDENTIFICATION ENCODING PROCESS." A label entitled "Encoding Process" is more indicative of a method claim than it is of an apparatus claim. Indeed, the '992 patent, which is based on the same specification as the '702 patent, contains a method claim 41 which discloses identification encoding not as an apparatus, but as a step in a method:

> 41. A method of transmitting information to remote locations, the transmission method comprising the steps, performed by a transmission system, of:
> storing items having information in a source material library;
> retrieving the information in the items from the source material library;
> **assigning a unique identification code to the retrieved information**;
> placing the retrieved information into a predetermined format as formatted data;
> placing the formatted data into a sequence of addressable data blocks;
> compressing the formatted and sequenced data blocks;
> storing as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code; and
> sending at least a portion of the file to one of the remote locations.

('992 24:54-25:5)

Notwithstanding the "process" label, based on the written description the Court finds that block "112" is a diagram of what the patentee meant by "identification encoder." However, the references to

block 112 in the specification do not assist the Court in defining what an "identification encoder" is. All that the specification does is to describe what the "identification encoder" preferably must do. The specification does not disclose a circuit, a computer operating a software algorithm, or other apparatus which performs the functions designated for the "identification encoder."

Under certain circumstances, it may be permissible to claim invention of an apparatus and include in the specification only a block diagram along with a description of some of its functions. However, this method of claiming an apparatus is only permissible if the device is a conventional one, such that a person of ordinary skill would readily understand what the device is. Claiming an apparatus using only a block diagram with functional description is indefinite when the patentee names the device using a coined term and the various functions could be performed by an indefinite variety of devices.

Acacia's expert witness, Mr. Weiss, testified:

> Q. Does the '702 patent identify any single structure for identification encoder?
> A. No, it does not.
> Q. Does the '702 patent require any single structure for identification encoder?
> A. Does it require? No, it does not.

(TR. 146:10-15.)

* * *

> Q. Take a look at column 6, line 39 through 42. What else, if anything, would the hypothetical person of ordinary skill have understood about the identification encoder from reading that portion of the specification?
> A. . . .that the identification encoder could similarly be located at any of those places in the system.

(TR. 93:5-18.)

At one point, Mr. Weiss stated that the only non-optional function of the "identification encoder" was "assigning a unique identification code." His stated assessment was based on the wording of the patent description. On the basis of Mr. Weiss' opinion, Acacia contends that the only function to be included in the construction of "identification encoder" is assignment of a unique identification code. The Court, however, must also include functions which may be worded as optional, but which would render the invention inoperable were they not included. If the Court did not do so, the patent would have no utility. Indeed, at another point in his testimony, Mr. Weiss disagreed with the "only non-optional function" analysis, stating that one would have to list other functions of the "identification encoder." (TR. 291-293.)

The Court confirms its earlier conclusion that at the time of the invention, one of ordinary skill in the art would not understand the scope or bounds of the structure of the term "identification encoder" when that term is read in light of the specification, rendering the claim term "identification encoder" indefinite. In its July 12 Order, the Court defined the term by using its nonspecific function—encoding an identification—and defined it as an apparatus for performing that function. The Court now concludes that this functional definition is insufficient to comply with the requirement of definiteness. The Court finds "identification encoder" indefinite and on that basis finds claims 1, 17 and 27 invalid. As with the "sequence encoder," the Court leaves for later consideration the affect of this finding on dependent claims.

V. CONCLUSION

The Court concludes that the claim term "sequence encoder" is indefinite and renders independent claims 1, 17 and dependent claim 32 of the '702 patent invalid. The Court reserves for later proceedings whether the invalidity of claims 1 and 17 affect the validity of each claim which depend from these claims. 35 U.S.C. § 282.

The Court concludes that the claim term "identification encoder" is indefinite and renders independent claims 1, 17 and 27 of the '702 patent invalid. The Court also reserves for later proceedings whether the invalidity of the independent claims affect the validity of claims which depend from them.

The Court invites any party desiring to file motions based on this Order to do so in accordance with the Local Rules of the Court. The Court also invites the parties to tender to the Court requests for construction of other terms. To accommodate potential motions and further claim construction proceedings, the Court specially sets a hearing on **February 24, 2006 at 9:00 a.m.** to hear any such motions. If no motions are filed, the parties are ordered to appear on that date at **10:00 a.m.** for a case management conference. In advance of the scheduled proceedings, the Court will advise the parties of the matters which it will consider and what pre-conference submissions are required.

***Acacia Media Technologies Corp. v. CSC Holdings, Inc.*, E.D. New York, C.A. No. 2:05-2036**
***Acacia Media Technologies Corp. v. Time Warner Cable, et al.*, S.D. New York, C.A. No. 1:05-4148**

BEFORE WM. TERRELL HODGES, CHAIRMAN, JOHN F. KEENAN, D. LOWELL JENSEN, J. FREDERICK MOTZ, ROBERT L. MILLER, JR., KATHRYN H. VRATIL AND DAVID R. HANSEN, JUDGES OF THE PANEL

TRANSFER ORDER

Before the Panel is a motion brought, pursuant to Rule 7.4, R.P.J.P.M.L., 199 F.R.D. 425, 435-36 (2001), by i) defendant CSC Holdings, Inc., in one Eastern District of New York action (*CSC*), and ii) defendants Time Warner Cable, Inc., and Bresnan Communications LLC in one Southern District of New York action (*Time*). Movant(s) in each action ask the Panel to vacate its order conditionally transferring the action to the Northern District of California for inclusion in the centralized pretrial proceedings occurring there in this docket before Judge James Ware. The plaintiff in both actions, Acacia Media Technologies Corp. (Acacia), supports transfer of both actions.

On the basis of the papers filed and hearing session held, the Panel finds that these two actions involve common questions of fact with actions in this litigation previously transferred to the Northern District of California, and that transfer of the actions to that district for inclusion in the coordinated or consolidated pretrial proceedings occurring there will serve the convenience of the parties and witnesses and promote the just and efficient conduct of the litigation. The Panel is persuaded that transfer is appropriate for reasons expressed by the Panel in its original order directing centralization in this docket. In that order, the Panel held that the Northern District of California was a proper Section 1407 forum for actions involving allegations of infringement and invalidity of one or more of five Acacia patents sometimes referred to as the "Yurt family" of patents (after the last name of the inventor of the patents). *See In re Acacia Media Technologies Corp. Patent Litigation*, 360 F.Supp.2d 1377 (J.P.M.L. 2005). Not unlike certain parties' arguments raised in opposition to centralization when the Panel first considered the question of Section 1407 transfer in this docket, the parties opposing transfer of *CSC* and *Time* predicate much of their opposition on concerns over the impact that transfer will have on their actions, in view of the more advanced status of proceedings in other MDL-1665 actions. Now, as then, however, Section 1407 will permit all actions involving common Acacia patents to proceed in one litigation before a single transferee judge who can structure pretrial proceedings to consider all parties' legitimate discovery needs, while ensuring that common parties and witnesses are not subjected to discovery demands which duplicate activity that has already occurred in constituent MDL-1665 actions. As continues to be the case, the transferee court remains free to make appropriate decisions regarding any impact that the earlier centralized actions may have on pretrial proceedings in the more recently filed *CSC* and *Time*.

IT IS THEREFORE ORDERED that, pursuant to 28 U.S.C. § 1407, these two actions are transferred to the Northern District of California and, with the consent of that court, assigned to the Honorable James Ware for inclusion in the coordinated or consolidated pretrial proceedings occurring there in this docket.

FOR THE PANEL:

Attorneys for Plaintiff
ACACIA MEDIA TECHNOLOGIES CORPORATION

UNITED STATES DISTRICT COURT

FOR THE NORTHERN DISTRICT OF CALIFORNIA

SAN JOSE DIVISION

In re ACACIA MEDIA TECHNOLOGIES CORPORATION	CASE NO. 05 CV 01114 JW MDL No. 1665 **PLAINTIFF ACACIA MEDIA TECHNOLOGIES CORPORATION'S PROPOSED DEFINITIONS AND CITATIONS TO INTRINSIC RECORD FOR CLAIM TERMS FROM THE '863 AND '720 PATENTS AND TERMS FROM THE '992 PATENT THAT THE COURT HAS ALREADY CONSTRUED** **DATE:** N/A **TIME:** N/A **CTRM:** Hon. James Ware

Plaintiff Acacia Media Technologies Corporation ("Acacia") hereby provides its proposed definitions of the claim terms from the '863 and '720 patents identified by both Acacia and defendants and citations to the intrinsic record supporting Acacia's proposed definitions. Acacia further provides its proposed definitions of the claim terms from the '992 patent which the Court previously construed and which the Round 3 Defendants seek reconsideration.

At the present time, Acacia has not received any of defendants' proposed definitions for

these terms and has not received discovery from defendants regarding their accused systems and methods or any of defendants' invalidity contentions. Accordingly, Acacia reserves the right to modify its proposed definitions for these claim terms when Acacia receives defendants' proposed definitions and when Acacia receives discovery from defendants regarding their accused systems and methods or any of defendants' invalidity contentions.

Patent Claim Term	**Citations to Intrinsic Record Supporting Acacia's Proposed Definitions**	**Acacia's Proposed Definitions**
1. "transmitting compressed, digitized data representing a complete copy of at least one item of audio/video information at a non-real time rate from a central processing location" '863 patent – 14	'863 patent, 2:1-5; 4:12-5:7; 5:56-62; 6:30-48; 6:49-7:35; 9:48-10:24; 15:29-16:45; 18:8-39; Figures 1d-1g; 2a, 2b, and 7.	This step of transmitting includes, but is not limited to, the steps of: • "inputting an item . . ." • "assigning a unique identification code . . ." • "formatting the item. . ." • "compressing the formatted item. . ." • "storing, as a file, . . ."; and • "sending at least a portion . . ." The phrase "compressed, digitized data representing a complete copy of at least one item of audio/video information" means that the data is a reproduction of at least one entire item of audio/video information in a compressed, digitized data form. The term "non-real time rate" means a rate (described in terms of time) that is different than the actual rate (described in terms of time) during which a particular item (e.g., video or audio) is listened to or viewed. Only the "sending" step must be performed at a central processing location. The term "central processing location" does not require construction, however, it may be described as a position or site where processing occurs.
2. "wherein the transmitting step comprises"		The phrase "wherein the transmitting step comprises" refers to the step of "transmitting

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
'863 patent – 14		compressed, digitized data . . .," which is described above as Term No. 1. The use of the open-ended transitional phrase "comprising" means that the transmitting step includes, but is not limited to, the "inputting. . .," "assigning . . .," "formatting . . .," "compressing . . .," "storing, . . .," and "sending . . ." steps listed thereafter and described below as Term Nos. 3-8.
3. "inputting an item having information into the transmission system" '863 patent – 14, 17	'863 patent, 6:49-7:11; Figure 2b.	The phrase "inputting an item having information into the transmission system" means the act of providing an item having information to the transmission system. The term "transmission system" has already been construed by the Court to mean "an assembly of elements, hardware and software, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system." In the context of claims 14 and 17 of the '863 patent, the subsequent transmission is to the local distribution system. The transmission system therefore is the system in which the steps of "inputting," "assigning," "formatting," "compressing," "storing," and "sending" occur.
4. "assigning a unique identification code to the item having information" '863 patent – 14, 17	Markman I, at 14:14-17. '863 patent, 2:27-47; 6:30-48; 10:9-11; 10:25-35; 11:1-3; 18:8-15; Figures 2a and 7.	The phrase "assigning a unique identification code to the retrieved information" has already been construed by the Court in the context of claims 1 and 41 of the '992 patent to mean "assigning a one-of-a-kind identifier to the information retrieved from an item that identifies the retrieved information through the conversion, ordering, compression, and storing processes." In the context of claim 14 of the '863 patent, this phrase means that the identifier identifies the item having information through the formatting, compressing, and storing processes. In the context of claim 17 of the '863 patent, this phrase means that the identifier identifies the item having information through the

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		formatting and compressing processes.
5. "formatting the item having information as a sequence of addressable data blocks" '863 patent – 14, 17	'863 patent, 5:56-62; 6:64-7:35; 7:50-8:43; 18:15-19; 18:53-66; Figures 2a, 7, and 8a-c.	The phrase "formatting the item having information as a sequence of addressable data blocks" means the act of converting the format of the information from the item and placing the formatted information into time encoded data blocks.
6. "compressing the formatted and sequenced data blocks" '863 patent – 14, 17	'863 patent, 9:24-65; 18:20-25; Figures 2a and 7.	The phrase "compressing the formatted and sequenced data blocks" does not require construction, however, it may be described as the act of condensing the amount of data in the formatted and sequenced data blocks.
7. "storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned unique identification code" '863 patent – 14	'863 patent, 9:66-10:35, 18:20-25; Figures 2a, 2b, and 7. Markman I, at 26:5-8.	The phrase "storing, as a file, the compressed, formatted, and sequenced data with the assigned unique identification code" has already been construed by the Court to mean "storing, as a file, the compressed, formatted, and sequenced data blocks accompanied by its unique identification code."
8. "sending at least a portion of the file at the non-real time rate to the local distribution system" '863 patent – 14	'863 patent, 2:1-5; 4:13-5:7, 15:19-16:45; 18:40-42; 19:4-19, Figures 1d-1g; 2b, 7, and 8e.	The phrase "sending at least a portion of the file at the non-real time rate to the local distribution system" means the act of transmitting electronically or optically at least a portion of the file at the non-real time rate to the local distribution system.
9. "receiving the transmitted compressed, digitized data representing a complete copy of the at least one item of audio/video information, at a local distribution system, remote from the central processing location" '863 patent – 14, 17 '720 patent – 8, 11	'863 patent, 4:13-5:7; 17:18-31; 18:40-45; Figures 1d-1g; 6, and 7.	The phrase "receiving the transmitted compressed, digitized data representing a complete copy of the at least one item of audio/video information, at a local distribution system, remote from the central processing location" means the act of receiving the reproduction of at least one entire item of audio/video information in a compressed, digitized data form at a local distribution system. The local distribution system is an assembly of elements, hardware and software, that function together to receive transmitted data, store the data, decompress the data, and transmit the data to at least one subscriber receiving station.

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		The local distribution system is at a location that is distant in space from the location of the central processing location.
10. "storing the received compressed digitized data representing the complete copy of the at least one item at the local distribution system" '863 patent – 14, 17 '720 patent – 8, 11	'863 patent, 4:29-5:7; Figures 1f; 2b, 6, and 7.	The phrase "storing the received compressed digitized data representing the complete copy of the at least one item at the local distribution system" means "storing a copy such that all of the received data is in storage at the same time."
11. "in response to the stored compressed, digitized data, transmitting a representation of the at least one item at a real-time rate. . ." '863 patent – 14	'863 patent, 4:13-5:7; 15:14-28; 19:4-19, Figures 1f; 2a, 6, 7, and 8e.	The phrase "transmitting a representation of the at least one item" means the act of transmitting a reproduction of the item. In the context of claim 14 of the '863 patent, the "representation of the at least one item" means that the reproduction of the item is in a decompressed format. The phrase "in response to the stored compressed, digitized data" means that the compressed, digitized data stored at the local distribution system (in the previous step) which was decompressed (in the next step) is converted to the representation of the item that is transmitted. A "real-time rate" is a rate (described in terms of time) that is the actual rate (described in terms of time) during which a particular item (e.g., video or audio) is listened to or viewed.
12. "at least one of a plurality of subscriber receiving stations coupled to the local distribution system" '863 patent – 14	'863 patent, 4:13-5:7; 17:18-61; Figures 1d-1g; 6, and 7.	The term "subscriber receiving station" means "an assembly of elements, hardware and software, capable of functioning together to receive a representation of an item." The term "coupled to" has already been construed by the Court to mean that two elements are directly attached to one another such that using a diskette to transfer information from one to another would mean that the two elements are not "coupled to" one

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		another.
13. "decompressing the compressed, digitized data representing the at least one item of audio/video information after the transmission step wherein the decompressing step is performed in the local distribution system to produce the representation of the at least one item for transmission to the at least one subscriber station" '863 patent – 14	'863 patent, 4:29-5:7; 17:44-52; Figures 1d-1g and 6.	The phrase "decompressing the compressed, digitized data representing the at least one item of audio/video information after the transmission step wherein the decompressing step is performed in the local distribution system to produce the representation of the at least one item for transmission to the at least one subscriber station" does not require construction, however, it may be described as the act of expanding compressed data. It is the stored compressed, digitized data that was received and stored by the local distribution system that is decompressed.
14. The order of the steps of claim 14 of the '863 patent.	'863 patent, 5:56-19:19; Figures 1d-1g, 2a, 2b, 6, and 7.	The first two steps of claim 14 of the '863 patent: • "inputting an item. . ."; and • "assigning a unique identification code. . ." are performed first, however, they may be performed in any order with respect to each other. The remainder of the steps of claim 14 of the '863 patent are performed in the following order, after the first two steps of the claim are performed: 1. "formatting the item. . ."; 2. "compressing the formatted and sequenced data blocks"; 3. "storing, as a file, . . ."; 4. "sending at least a portion. . ."; 5. "receiving the transmitted compressed,

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		digitized data. . ."; 6. "storing the received compressed digitized data representing the complete copy. . ."; 7. "decompressing the compressed digitized data. . ."; 8. "transmitting a representation . . . to at least one of a plurality of subscriber receiving stations. . ." There is no limitation that any step of claim 14 begins and occurs only after a prior step or steps have been completed.
15. "wherein the inputting step comprises inputting the item having information as blocks of digital data." '863 patent – 15, 18	'863 patent, 6:49-7:11; Figure 2b.	The phrase "wherein the inputting step comprises inputting the item having information as blocks of digital data" means that the item having information that is input into the transmission system includes, but is not limited to, blocks of digital data.
16. "wherein the inputting step comprises inputting the item having information as an analog signal; and converting the analog signal to blocks of digital data" '863 patent – 16, 19	'863 patent, 6:49-7:11; Figure 2b.	The phrase "wherein the inputting step comprises inputting the item having information as an analog signal and converting the analog signal to blocks of digital data" means that the item having information that is input into the transmission system includes, but is not limited to, an analog signal. Claims 16 and 19 add the step, to claims 14 and 17, respectively, that the analog signal is converted to blocks of digital data.
17. "formatting items of audio/video information as compressed digitized data at a central processing location" '863 patent -- 17	'863 patent, 5:56-7:34; 9:24-65; 18:8-25; Figures 2a and 7.	The step of formatting includes, but is not limited to, the steps of: • "inputting an item . . ."; • "assigning a unique identification code. . ."; • "formatting the item. . ."; • compressing the formatted and

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		sequenced data blocks." The term "central processing location" does not require construction; however, it may be described as a position or site where processing occurs.
18. "wherein the formatting step comprises" '863 patent -- 17		The phrase "wherein the formatting step comprises" refers to the step of "formatting items of audio/video information. . .," which is described above as Term No. 17. The use of the open-ended transitional phrase "comprising" means that the formatting step includes, but is not limited to, the "inputting. . .," "assigning . . .," "formatting . . .,"and "compressing . . ." steps listed thereafter and described above as Term Nos. 3-6.
19. "transmitting compressed, digitized data representing a complete copy of at least one item of audio/video information from a central processing location" '863 patent – 17	'863 patent, 4:13-5:7; 15:14-16:44; Figures 1d-1f and 2b.	The term "compressed, digitized data representing a complete copy of at least one item of audio/video information" means that the data is a reproduction of at least one entire item of audio/video information in a compressed, digitized data form.
20. "using the stored compressed, digitized data to transmit a representation of the at least one item to at a plurality of subscriber receiving stations coupled to the local distribution system" '863 patent – 17	'863 patent, 4:62-5:7; 15:14-28; Figures 1f; 2a, 6, and 7.	The phrase "using the stored compressed, digitized data to transmit a representation of the at least one item" means that a reproduction of the item is transmitted. The stored, compressed digitized data that was received and stored in the local distribution system (in the prior two steps) is converted to the representation of the item which is transmitted. The term "subscriber receiving station" means "an assembly of elements, hardware and software, capable of functioning together to receive the representation of the item." The term "coupled to" has already been construed by the Court to mean that two elements are directly attached to one another such that using a diskette to transfer information from one to another would mean

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		that the two elements are not "coupled to" one another.
21. The order of the steps of claim 17 of the '863 patent.	'863 patent, 5:56-19:19; Figures 1d-1g, 2a, 2b, 6, and 7.	The first two steps of claim 17 of the '863 patent: • "inputting an item. . ."; and • "assigning a unique identification code. . ." are performed first, however, they may be performed in any order with respect to each other. The remainder of the steps of claim 17 of the '863 patent are performed in the following order, after the first two steps of the claim are performed: 1. "formatting the item. . ."; 2. "compressing the formatted and sequenced data blocks"; 3. "transmitting . . . from the central processing location"; 4. "receiving the transmitted compressed, digitized data. . ."; 5. "storing the received compressed digitized data representing the complete copy. . ."; and 6. "using the stored compressed, digitized data to transmit . . ." There is no limitation that any step of claim 17 begins and occurs only after a prior step or steps have been completed.
22. "A digital audio/video communication network" '720 patent – 4		This preamble is not limiting. The term "communications network" means a combination of elements or devices used for communication.

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
23. "a reception system in data communication with a plurality of subscriber selectable receiving stations" '720 patent – 4	'720 patent, 4:11-5:5; Figures 1d-1f; and 6.	The term "reception system" has already been construed by the Court to mean "an assembly of elements, hardware and software, capable of functioning together to receive items of information." The term "in data communication with" has already been construed by the Court to mean "two or more devices connected such that data is being transferred between the devices in real time, where real time means that the receiving system receives the data in the same electronic time frame as the transmission system sends the data."
24. "subscriber selectable receiving stations" '720 patent – 4, 8, and 11	'720 patent, 1:66-2:2; 3:66-4:48; 5:6-15; 14:28-45; 18:26-38.	The term "subscriber selectable" means that the subscriber is capable of choosing, from among the plurality of receiving systems, the receiving station or stations to which information is transmitted. The term "receiving station" means an assembly of elements, hardware and software, capable of functioning together to receive information.
25. "means for receiving compressed, digitized data representing at least one item of audio/video information at a non-real time rate" '720 patent – 4	'720 patent, 16:18-48; 17:13-25; Figure 6, reference no. 201.	Construed pursuant to 35 U.S.C. § 112, ¶ 6 – a transceiver (201), and all equivalents.
26. "means for storing a complete copy of the received compressed, digitized data" '720 patent – 4	'720 patent, 4:35-5:5; 12:17-61; 17:25-32; 18:39-45; Figures 1f (reference no. 200c) and 6 (reference no. 203).	Construed pursuant to 35 U.S.C. § 112, ¶ 6 – storage (203 and 200c), and all equivalents.
27. "means, . . . , for transmitting a representation of the at least one item of audio/video information	'720 patent, 4:49-59; 15:8-16:39; 18:64-19:13, Figures 1g, 2b, and 8e.	Construed pursuant to 35 U.S.C. § 112, ¶ 6 – a transmission data converter (aka transmission format conversion CPU) (reference no. 119) and a transmitter, transceiver, cable television transmitter, modem, broadcast television

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
at a real-time rate to at least one of the plurality of subscriber selectable receiving stations" '720 patent – 4		transmitter, data coupler, satellite transmitter, (See, e.g., reference nos. 122, 200d) and all equivalents.
28. "responsive to the stored, compressed digitized data" '720 patent – 4	'720 patent, 4:60-5:5; 15:8-23; Figures 1f, 2a, 6, and 7.	The phrase "responsive to the stored compressed, digitized data" means that the compressed digitized data that was stored in the means for storing is converted to the representation of the at least one item of video information that is transmitted.
29. "wherein the at least one of the plurality of subscriber selectable stations is located at a premises geographically separated from the location of the reception system" '720 patent – 4, 8, 11	'720 patent, 4:11-5:5; Figures 1d-1f, 2b, 6, and 7.	The phrase "plurality of subscriber selectable stations is located at a premises geographically separated from the location of the reception system" means that the reception system is located at a premises which is geographically separated (i.e., apart) from the site or position where the at least one of the plurality of subscriber selectable stations is located.
30. "positioned at the same location" '720 patent – 4, 8, 11	'720 patent, 5:52-58; Figures 1d-1g and 2a.	The phrase "positioned at the same location" means "situated at the same site or position."
31. "a processing station for formatting items of audio/video information as compressed, digitized data and transmitting the compressed, digitized data representing at least one item of audio/video information at the non-real time rate to the means for receiving" '720 patent – 6, 7	'720 patent, 5:52-58; Figures 1d-1g and 2a.	The term "processing station" means a facility where a processing system is located, wherein the processing system performs the acts of: (1) formatting items of audio/video information as compressed, digitized data and (2) transmitting the compressed, digitized data representing at least one item of audio/video information at the non-real time rate to the means for receiving.
32. "means for inputting items of audio/video information"	'720 patent; 6:44 – 7:30; Figure 2a, reference nos. 124 and 127.	Construed pursuant to 35 U.S.C. § 112, ¶ 6 -- analog input receiver (127) and/or a digital input receiver (124), and all equivalents.

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
'720 patent -- 7		
33. "conversion means for placing each item of audio video information into a predetermined format as formatted data" '720 patent – 7	'720 patent, 6:57-7:7:30; Figure 2a, reference nos. 123a, 123b, 125a, and 125b.	Construed pursuant to 35 U.S.C. § 112, ¶ 6 – an analog audio converter (123a), an analog video converter (123b), a digital audio formatter (125a) and/or a digital video formatter (125b), and all equivalents.
34. "compression means for compressing the formatted data" '720 patent – 7	'720 patent, 9:19-65 and 18:20-25; Figure 2a, reference no. 116.	Construed pursuant to 35 U.S.C. § 112, ¶ 6 – a compressor (116), and all equivalents.
35. "transmitter means for sending compressed formatted data for the at least one item of audio/video information at the non-real time rate to the reception system" '720 patent – 7	See, e.g., reference nos. 122, 200d) and all equivalents, as described in the '720 patent at 4:49-59 and 15:14-16:39, and 18:64-19:12 and shown in Figures 1g, 2b, 6, and 8e.	The term "transmitter" is sufficient structure to perform the claimed function and therefore overcome the presumption of 35 U.S.C. § 112, ¶ 6. If construed pursuant to 35 U.S.C. § 112, ¶ 6 – a transmitter, transceiver, cable television transmitter, modem, broadcast television transmitter, data coupler, satellite transmitter, and all equivalents.
36. "transmitting compressed, digitized data representing a complete copy of at least one item of audio/video information at a non-real time rate from a central processing location to a local distribution system remote from the central processing location." '720 patent – 8	'720 patent, 2:3-8; 4:11-5:5, 15:14-16:40; 18:33-35; 18:64-19:11; Figures 1d-1g; 2b, 7, and 8e.	The phrase "compressed, digitized data representing a complete copy of at least one item of audio/video information" means that the data is a reproduction of at least one entire item of audio/video information in a compressed, digitized data form. The term "non-real time rate" means a rate (described in terms of time) that is different than the actual rate (described in terms of time) during which a particular item (e.g., video or audio) is listened to or viewed. The term "central processing location" means a position or site where processing occurs. The local distribution system is an assembly of elements, hardware and software, that function together to receive transmitted data, store the data, and transmit the data to at least one

Patent Claim Term	Citations to Intrinsic Record Supporting Acacia's Proposed Definitions	Acacia's Proposed Definitions
		subscriber selectable receiving station. The local distribution system is at a location that is distant in space from the location of the central processing location.
37. "receiving, into a **receiving means**, the transmitted compressed, digitized data representing a complete copy of the at least one item" '720 patent – 8, 11	'720 patent, 4:11-5:27, and 17:13-32; Figures 1d-1g, and 6, reference no. 201.	The "receiving means" is construed pursuant to 35 U.S.C. § 112, ¶ 6 – a transceiver (201), and all equivalents.
38. "storing, in a **storing means**, the received compressed, digitized data representing a complete copy of the at least one item at the local distribution system" '720 patent – 8, 11	'720 patent, 4:11-5:27, and 17:13-32; Figures 1d-1g, and 6, reference nos. 203 and 200c.	The "storing means" is construed pursuant to 35 U.S.C. § 112, ¶ 6 – storage (203 and 200c), and all equivalents.
39. ". . . transmitting, using a **transmitting means**, a representation of the at least one item at a real-time rate to at least one of a plurality of subscriber selectable receiving stations." '720 patent – 8	'720 patent, 4:49-59, 15:8-16:39, and 18:64-19:12 and shown in Figures 1g, 2b, 6, and 8e.	The "transmitting means" is construed pursuant to 35 U.S.C. § 112, ¶ 6 – a transmission data converter (aka transmission format conversion CPU) (reference no. 119) and a transmitter, transceiver, cable television transmitter, modem, broadcast television transmitter, data coupler, satellite transmitter, and all equivalents.
40. "in response to the stored compressed, digitized data, transmitting, . . . , a representation of the at least one item at a real-time rate to at least one of a plurality of subscriber selectable receiving stations."	'720 patent, 4:11-5:5; 15:8-24; 18:64-19:12, Figures 1f; 2a, 6, 7, and 8e.	The phrase "in response to the stored compressed, digitized data transmitting, using a transmitting means, a representation of the at least one item" means that a reproduction of the item is transmitted. The stored, compressed digitized data that was received and stored in the storing means at the local distribution system (in the prior two steps) is converted to the representation of the item which is transmitted.

'720 patent – 8		A "real-time rate" is a rate (described in terms of time) that is the actual rate (described in terms of time) during which a particular item (e.g., video or audio) is listened to or viewed.
41. "using the stored compressed, digitized data to transmit using a transmitting means, a representation of the at least one item to at least one of a plurality of subscriber selectable receiving stations." '720 patent – 11	'720 patent, 4:11-5:5; 15:8-24; 18:64-19:12, Figures 1f; 2a, 6, 7, and 8e.	The phrase "using the stored compressed, digitized data to transmit using a transmitting means, a representation of the at least one item to at least one of a plurality of subscriber selectable receiving stations" means that a reproduction of the item is transmitted. The stored, compressed digitized data that was received and stored in the storing means at the local distribution system (in the prior two steps) is converted to the representation of the item which is transmitted.
42. The order of the steps of claim 8.	'720 patent, 5:52-19:12; Figures 1d-1g, 2a, 2b, 6, and 7.	The steps of claim 8 of the '720 patent must be performed in the following order: 1. "transmitting compressed, digitized data . . ."; 2. "receiving, into a receiving means, . . ."; 3. "storing, in a storing means, . . ."; and 4. ". . . transmitting, using a transmitting means, . . ." There is no limitation that any step of claim 8 begins and occurs only after a prior step or steps have been completed.
43. The order of the steps of claim 11.	'720 patent, 5:52-19:12; Figures 1d-1g, 2a, 2b, 6, and 7.	The steps of claim 11 of the '720 patent must be performed in the following order: 1. "formatting items of audio/visual information. . . ." 2. "transmitting compressed, digitized data . . ."; 2. "receiving, into a receiving means, . . ."; 3. "storing, in a storing means, . . ."; and

		4. "using the stored compressed, digitized data to transmit, using a transmitting means, . . ." There is no limitation that any step of claim 11 begins and occurs only after a prior step or steps have been completed.
44. "transmission system" '992 patent – 19, 41, and 47 '275 patent – 2, 5 '863 patent – 14, 17	Markman I, at 28:11-13. Markman II, at 3:11-14.	The term "transmission system" has already been construed by the Court to mean "an assembly of elements, hardware and software, that function together to convert items of information for storage in a computer compatible form and subsequent transmission to a reception system."
45. "reception system" '275 patent – 2, 5 '720 patent – 4	Markman I, at 28:21-22.	The term "reception system" has already been construed by the Court in the context of the claims of the '702 patent to mean "an assembly of elements, hardware and software, that function together to receive items of information." In addition to the Court's construction, as used in claims 2 and 5 of the '275 patent, the reception system also stores and plays back information. "Play back" is the process of providing signals comprising video and/or audio information, wherein the signals can be displayed and/or heard on a device, such as an audio amplifier and/or television, or recorded. In addition to the Court's construction, as used in claim 4 of the '720 patent, the reception system also stores and transmits audio/video information.
46. "storing items having information in a source material library" '992 patent – 41	Markman I, at 25:16-18.	The phrase "storing items having information in a source material library" has already been construed to mean "adding items having information to a collection of existing materials."
47. "items containing information" (and the related term "items having information")	Markman I, at 11:6-7.	The phrase "items containing (or having) information" has already been construed by the Court to mean "items containing information in analog or digital form." The term "item" means "thing" and therefore the Court's construction

'992 patent – 19, 41 '275 patent – 2, 5 '863 patent – 14, 17		means "things containing information in analog or digital form."
48. "remote locations" '992 patent – 41	Markman I, at 7:20-23; Markman II, at 4:1-5.	The term "remote locations," as used in claim 41, has already been construed by the Court to mean "positions or sites distant in space from the transmission system."
49. "retrieving the information in the items from the source material library" '992 patent – 41	Markman I, at 13:3-5; 25:16-18	The phrase "retrieving the information in the items from the library means" has already been construed by the Court to mean "to get back the information that is contained in the items which are stored in the source material library." The term "source material library" has already been construed by the Court to mean "a collection of existing materials."
50. "assigning a unique identification code to the retrieved information" '992 patent – 41	Markman I, at 14:14-17.	The phrase "assigning a unique identification code to the retrieved information" has already been construed by the Court to mean "assigning a one-of-a-kind identifier to the information retrieved from an item that identifies the retrieved information through the conversion, ordering, compression, and storing processes."
51. "placing the formatted data into a sequence of addressable data blocks" (and the related term "ordered data blocks") '992 patent – 41	Markman I, at 22:15-20; 23:3-6.	The phrase "placing the formatted data into a sequence of addressable data blocks" has already been construed by the Court to mean the act of time encoding the formatted data blocks.
52. "storing, as a file, the compressed, formatted, and sequenced data with the assigned unique identification code" '992 patent – 41	Markman I, at 26:7-8.	The phrase "storing, as a file, the compressed, formatted, and sequenced data with the assigned unique identification code" has already been construed by the Court to mean "storing, as a file, the compressed, formatted, and sequenced data blocks accompanied by its unique identification code."
53. "retrieve" '992 patent – 41	Markman I, at 13:3.	The term "retrieve" has already been construed by the Court to mean "to get something back."
