15 Deposition of S. MERRILL WEISS, taken on behalf of
16 Defendant Coxcom, Inc., and Hospitality Network, at
17 601 South Figueroa Street, Suite 3400, Los Angeles,
18 California, beginning at 9:37 a.m. and ending at 4:58
19 p.m. on Friday, September 2, 2005, before BETH
20 HANDWEILER, Certified Shorthand Reporter No. 3492.

25

Weiss, Merrill

1 common knowledge in 1990, correct? Common knowledge
2 among people of ordinary skill in this art?

3 A I believe it was.

4 Q What is the CCITT?

5 A I can't quite do it with the right French
6 accent, but it's the international telecommunications
7 consultative committee basically, in English.

8 Q Do you know Dr. Lippman?

9 A Yes.

10 Q You knew him before this deposition?

11 A Yes.

12 Q Would you agree with me that he has an
13 outstanding reputation in his field?

14 A Yes.

15 Q Pardon me?

16 A Yes.

17 Q Are you familiar with his work at MIT?

18 A Somewhat.

19 Q Are you and Dr. Lippman in the same field?

20 A In some ways, yes, and in some ways, no.

21 Q Can you explain that?

22 A We both do work in the area of -- let me call
23 it electronic media. He approaches it much more from
24 the computer and computing direction. I approach it
25 much more from the television and electronic media

Weiss, Merrill

1 direction.

2 Q Knowing his qualifications and after reading
3 the patent, do you have any doubt that he's qualified to
4 give opinions about this technology?

5 A Qualified to give opinions? I would say yes.
6 It doesn't mean I'll agree with them.

7 Q Are you going to give opinions at the hearing
8 responsive to Mr. Lippman's opinions?

9 A I don't believe so.

10 Q You just made the day a little shorter, but
11 we'll talk about that a little more later.

12 Do the phrases "high level diagram" and
13 "detailed block diagram" have any significance to you?

14 A I understand what they mean.

15 Q Are there any differences?

16 A It would depend on the particular way somebody
17 used those terms, but I would normally expect there to
18 be differences.

19 Q What is a broadcast engineer, sir?

20 A A broadcast engineer is someone who does
21 technical work in the field of broadcasting.

22 Q What kind of technical work?

23 A There is a whole range of work that falls under
24 the category of broadcast engineering, so --

25 Q Let me ask it a different way then. What do

Weiss, Merrill

1 you mean by broadcasting?

2 A Broadcasting historically has been -- has
3 involved the transmission of signals using radio waves.
4 It has come to have a much broader meaning in recent
5 years, so that it involves the dissemination of
6 programming to the public through either the classic
7 radio frequency broadcasting through distribution on
8 satellite, or cable. Broadcast engineering is even
9 being applied these days to the development of content
10 that -- and distribution of content that's flowing over
11 the internet.

12 Q Have you ever built an encoder yourself? I'm
13 not talking about designating it to somebody else. Have
14 you ever built one?

15 A Any kind of encoder?

16 Q Yes, sir.

17 A Yes.

18 Q What kind?

19 A An NTSC encoder.

20 Q What is an NTSC encoder?

21 A It stands for National Television Systems
22 Committee. The encoder was a color encoder to take
23 signals from a camera and convert them into an NTSC
24 compatible color television signal.

25 Q When did you do this?

Weiss, Merrill

1 A I want to say in the late '70s. Mid to late
2 '70s. Somewhere in there.

3 Q So what was encoded in the NTSC encoder?

4 A What was encoded?

5 Q Yes, sir.

6 A Well, the way an NTSC encoder works, it takes
7 input from the three signals coming out of a color
8 camera, red, green and blue. It converts them into a
9 luminance and two color different signals, and then
10 modulates the color different signals onto a
11 sub-carrier. In any event, I guess the short answer is
12 what was encoded was television signals. We're probably
13 getting a little too technical.

14 MR. DORMAN: It happens in these cases.

15 BY MR. McMAHON:

16 Q Did these signals involve compression?

17 A NTSC is an analog system. I gave a paper once
18 that basically said that NTSC was the first compression
19 system, but it was analog as opposed to digital, in the
20 way it did its compression.

21 Q So it compressed analog signals?

22 A And the result was an analog signal, and it did
23 it using analog methods. I just thought of something,
24 too, by the way. When you were asking me earlier was I
25 involved in compression, you will notice in my resume

Weiss, Merrill

1 that I had a company called Imagex in the mid-'80s, and
2 we were involved in compression at that point.

3 Q Compression of what?

4 A I'm sorry, compression --

5 Q Compression of what?

6 A Of video.

7 Q Why?

8 A Why? Because we were trying to fit more images
9 into less space, both on optical disks and in memory.

10 Q For purposes of storage or transmission?

11 A For purposes of storage and processing, not
12 really transmission.

13 Q Are you an expert in data compression?

14 A No, I would not consider myself an expert in
15 data compression.

16 Q You have mentioned that you've -- rather your
17 CV refers to a number of committees that you are on,
18 SMPTE committees?

19 A Yes.

20 Q Do you get paid for your work with the SMPTE
21 committees?

22 A A few, yes. Mostly, no.

23 Q Why would you get paid?

24 A If a client needs a particular standard
25 developed or needs to have participation in the

Weiss, Merrill

1 A Yes. Broadcast engineering at least,
2 publications.

3 Q Can you give me an example of such
4 publications?

5 A Broadcast Engineering is the name of the
6 magazine, TV Technology, the SMPTE Journal. Perhaps the
7 IEEE Transactions on Broadcasting, although that tends
8 to be more in the radio frequency area, RF area. There
9 was another magazine back then that's now defunct. I'm
10 trying to remember what its name was. I think it was
11 called TV Broadcast. There are a whole range of others.
12 I mean there is one called Videography. There are lots
13 of technical journals -- or technical magazines is a
14 better term, related to electronic media industry that
15 existed then. And your question was specifically with
16 respect to broadcasting, was it not? Broadcast
17 technology?

18 Q My question was would the person of ordinary
19 skill in the art in January 1991 subscribe to
20 broadcasting publications, and then you said yes, and I
21 asked you to give me examples.

22 A Okay.

23 Q So you are done with your answer?

24 A Yes.

25 Q Would a person of ordinary skill in the art in

Weiss, Merrill

1 January 1991 have known about time codes?

2 A Absolutely.

3 Q Why?

4 A Prevalent in the industry.

5 Q Would the person of ordinary skill in the art
6 have been familiar with SMPTE 12M?

7 MR. DORMAN: This is January of '91?

8 MR. McMAHON: Right.

9 THE WITNESS: Yes.

10 BY MR. McMAHON:

11 Q Were ISO reports generally available to people
12 of ordinary skill in the art at that time?

13 A Available, yes. Probably not as widely spread
14 in terms of their being on people's shelves, but
15 certainly available.

16 Q What about ISO draft reports? Do you
17 understand they were published?

18 A Again -- well, certainly if they're available,
19 then some people would have them.

20 Q Some people of ordinary skill?

21 A Of ordinary skill.

22 Q Are you, sir, familiar with the MPEG video
23 committee draft report published in December 1990?

24 A That document per se I don't recollect, but
25 certainly I was aware of MPEG and all of its creations.

Weiss, Merrill

1 Q Were you aware of what was going on with MPEG
2 in December 1990 and January 1991?

3 A More or less.

4 Q Were people of ordinary skill in the art aware
5 of what was going on with MPEG and the ISO committee?

6 A Probably they were aware, but probably not on a
7 technical level, because there was certainly publication
8 going on back then about the activities of the
9 committee, but the document I don't think was actually
10 published until '91.

11 Q Would a person of ordinary -- well, maybe you
12 don't know this because you are not an expert in
13 compression. If you don't know, tell me. Would a
14 person of ordinary skill be familiar with discrete
15 co-sign transforms in January 1991?

16 A I have to think about the timing of that. I
17 wrote a book that covers discrete co-sign transforms,
18 but it was several years later. I think that was known
19 generally by then. Probably not that it was part of
20 MPEG, but it was known for its use in other schemes by
21 then.

22 Q Such as H.261?

23 A Video compression schemes, yes.

24 Q Would a person of ordinary skill in the art in
25 December 1990 or January 1991, have known about

Weiss, Merrill

1 I-frames, P-frames and B-frames?

2 A Certainly not B-frames, because they were part
3 of MPEG-2, and that didn't come until later.

4 Q You're sure about that?

5 A I am pretty sure about that.

6 Q I'm interrupting. Did you finish your previous
7 answer?

8 A No. I-frames and P-frames, probably -- well, I
9 don't remember whether those terms were used in earlier
10 documents, but the MPEG-1 document, if I remember
11 correctly, came out in early '91, and would have used
12 those terms, and that's after January. So I don't
13 believe that -- well, I just don't know whether -- don't
14 remember whether other documents were using that
15 terminology prior to then.

16 Q Did H.261 disclose how to code P-frames?

17 A I haven't looked at H.261 in a very long time.
18 I don't remember.

19 Q Was the concept of GOP, G-O-P, headers known to
20 people of ordinary skill in the art at the time we're
21 talking about?

22 A I don't recollect that concept prior to MPEG,
23 so unless it was contained in some other earlier
24 documents -- and I don't remember those earlier
25 documents well enough to know -- to be able to say with

Weiss, Merrill

1 any specificity.

2 Q Is this a true statement as of January 1991?

3 A video sequence of groups of pictures input to the
4 decoder may be different from the one at the encoder
5 output due to editing?

6 A I'm sorry, could you read that again?

7 Q I'm going to give you a statement. I want to
8 know whether it's true as of January 1991. A video
9 sequence of groups of pictures input to the decoder may
10 be different from the one at the encoder output due to
11 editing?

12 MR. DORMAN: Objection, unintelligible. If you
13 can answer it, answer it.

14 THE WITNESS: Due to editing? And so your
15 question is is that technically true?

16 BY MR. McMAHON:

17 Q Was that statement true at that time?

18 A If I understand it correctly, it's not even
19 true today, so I would presume it wasn't true then.

20 Q Why is it not true today?

21 A Because you don't normally do editing inside an
22 encoder, if I'm understanding the question correctly and
23 the statement correctly.

24 Q And if I took the last three words out there,
25 "due to editing," would the statement have been true as

Weiss, Merrill

1 of 1991, January?

2 MR. DORMAN: Why don't you restate it without
3 these three words.

4 BY MR. McMAHON:

5 Q A video sequence of groups of pictures input to
6 the decoder may be different from the one at the encoder
7 output?

8 A That would be true from several perspectives.

9 Q From what perspective, sir?

10 A The frames on the output of an encoder are sent
11 in a different sequence when they're in the encoded
12 stream than they occur on the input to the encoder and
13 on the output of a decoder. In addition to that,
14 because this kind of encoding is lossy, there will be
15 differences, once the video stream is decoded. So there
16 will be detectable, often noticeable, sometimes quite
17 noticeable differences between the input and the output
18 because of the lossy compression.

19 Q Have you ever heard of a sequence counter?

20 A Sequence counter? I've heard of many counters.
21 Maybe you're referring to some specific one in the
22 document. I can certainly understand what a sequence
23 counter would be.

24 Q Have you ever heard of a sequence counter?

25 MR. DORMAN: At any time?

Weiss, Merrill

1 inner workings of MPEG, I don't consider myself to be an
2 expert. When it comes to using it, evaluating it, a
3 variety of other things, I probably do have a sufficient
4 knowledge to be considered expert.

5 Q I don't understand that answer. When you use
6 it or evaluate it aren't you dealing with the inner
7 workings of MPEG?

8 A What I was differentiating was designing -- for
9 instance, designing an MPEG encoder from applying an
10 MPEG encoder. So I would not consider myself to be
11 sufficiently expert with MPEG to design the routine that
12 does the DCT and the zigzag scanning and things like
13 that, but I would be certainly sufficiently expert to
14 design a system that used MPEG-2, to choose equipment,
15 to set the parameters, things of that sort.

16 Q Going back to claim 7, there is a reference --
17 well, the word "transforms" appears. Does that mean
18 place?

19 A I'm sorry, does that mean?

20 Q Place or places.

21 A If I were looking for a synonym, I would
22 probably use one like converts perhaps.

23 Q How do you convert digital data blocks into a
24 group of addressable data blocks?

25 A In the initial case they're perhaps

Weiss, Merrill

1 unassociated. They're part of a -- or they're not
2 associated as part of a group. They may be part of a
3 sequence. I'm looking at a group as being a subset out
4 of a sequence, out of an overall sequence when I read
5 that. And so if I wanted to take some part of the
6 sequence and make a group out of it, that's what this
7 would be.

8 Q Well, what is the sequence that you're
9 referring to? In other words, what do you mean when you
10 say the word "sequence" in that previous answer?

11 A Let's suppose I've got -- let me call it an
12 audiovisual work, and that audiovisual work is composed
13 of a large number of frames of video and corresponding
14 audio segments. And I time encode that to indicate the
15 sequence from beginning to end of that audiovisual work.
16 That would be the -- call it the basic function of the
17 time encoder.

18 I could then subdivide that audiovisual work
19 into segments that would be where the frames within
20 those segments would be grouped together. And so I
21 would be converting the initial sequence into subsets
22 that would be represented by those groups. That's the
23 way I think about -- I've thought about it. That's why
24 I used the term convert. So I'm taking the initial
25 sequence, and out of that I'm making groups.

Weiss, Merrill

1 Q Tell me precisely what gets time encoded on
2 this invention.

3 A As I understand it, the frames of video get
4 time encoded. Or the data that represents those frames
5 of video get time encoded.

6 Q Before compression?

7 A It happens -- the time encoding takes place
8 before compression, but the code that represents the
9 time then continues to be associated with the individual
10 frames after compression.

11 Q What do you mean when you reference "the code
12 that represents the time"?

13 A When you time encode video content you apply to
14 it -- to each frame a value that states where it occurs
15 along a time continuum.

16 Q And where does this time stamp go?

17 A It depends on the form that the content is
18 expressed in. So, for instance, if you're talking about
19 a videotape and you're talking about a particular format
20 in a videotape, then it could go on an audio track as a
21 longitudinal time code, for instance. If you are
22 talking about another form of videotape, it could go in
23 the vertical interval of the video. If you are talking
24 about a digital representation, it could be expressed in
25 one of a couple of different ways as data within the --

Weiss, Merrill

1 within the data that represents the video frame.

2 So depending on how the video is -- how the
3 video itself is encoded or expressed, the time stamp, if
4 I could call it that, that applies to each frame would
5 be carried in a different way.

6 Q You're talking about SMPTE time stamps,
7 correct?

8 A That's what I have in mind specifically, yes.

9 Q Is that what the patent contemplates?

10 A Well that's certainly encompassed by what the
11 patent contemplates.

12 Q Well, what -- define for me, as precisely as
13 you can, what kind of time stamps are applied in the
14 time encoder 114?

15 A When you say define for you, do you mean define
16 at a highly technical level, or in terms of the
17 standards that might be used, or what kind of answer --

18 Q At the standard level. I want to know what
19 kind of time stamps are being applied.

20 A Well, the one that came immediately to my mind
21 when I saw this was the SMPTE 12M style time code.
22 Clearly there could be other -- I mean I could name a
23 number of other standards that exist that could have
24 been applied.

25 Q Such as?

Weiss, Merrill

1 A An earlier thing that I am aware of was called
2 IRIG, I-R-I-G, that was used for telemetry, I think, by
3 NASA. There were other time codes that existed for
4 telemetry and data stamping, as I recollect that, but
5 IRIG is the other one that comes to mind.

6 Q SMPTE and IRIG?

7 A There are others, but those are the ones --

8 Q Well, what others? This is my time to find out
9 what is in your mind.

10 A Those are the only ones that come to mind at
11 the moment. I know there are others, but I would have
12 to go back and think about it or do some research to get
13 you anymore.

14 Q So you had those VITC, V-I-T-C, time codes,
15 LITC time codes --

16 A LTC.

17 Q And then those data time codes under SMPTE,
18 right? You described three types --

19 A If you want to describe it as data time codes,
20 that's fine.

21 Q Well, how did you describe it? Give me a
22 label --

23 A One was called DVITC, which is essentially a
24 digital representation of an analog signal carrying
25 digital information. It's very convoluted. Another one

Weiss, Merrill

1 is where digital time code is carried as ancillary data
2 in the vertical interval. It's just carried as data.
3 There may be yet another representation that is
4 metadata.

5 Q These are the SMPTE time codes that fall within
6 the scope of the patent, in your opinion?

7 A Yes.

8 Q And are these the kinds of codes that a person
9 of ordinary skill would have concluded were contemplated
10 by the patent in December 1990 or January 1991?

11 A Actually I was going to mention that there were
12 time coding mechanisms that came in MPEG, but that was
13 after the patent. And, in fact, I think some of the
14 digital codes that I mentioned to you earlier may have
15 been after the patent. I was just thinking in general
16 about SMPTE time codes.

17 Q All right. Let's be real clear. My questions
18 before were not related time, the first one. I asked
19 you to tell me what kind of time codes are contemplated
20 by this patent and you told me SMPTE and IRIG. Now you
21 are telling me something else?

22 A No. I'm just saying that when I listed the
23 various forms of SMPTE time codes, I was doing that
24 without thinking about whether they were in existence in
25 1991, and so some of them that I told you about may have

Weiss, Merrill

1 come along after 1991. I'm trying to be as accurate as
2 I can be for you.

3 Q Either I'm slow or you're not being accurate.
4 Now you just mentioned MPEG. Are you telling me that
5 MPEG time stamps fall within the scope of this patent?

6 A No. What I said was that I was going to
7 mention MPEG, and then it occurred to me that MPEG came
8 later than the patent. And so therefore I was not
9 mentioning it. I probably shouldn't have said the words
10 to begin with, once I realized that it was after the
11 patent.

12 Q Well, forgetting the date of the patent, are
13 you of the opinion that MPEG time stamps fall within the
14 scope of this patent?

15 MR. DORMAN: Objection. The question is
16 unintelligible as asked.

17 BY MR. McMAHON:

18 Q Do you understand the question? Are you of the
19 opinion that MPEG time stamps fall within the scope of
20 the patent?

21 A Taken by themselves they might not, but taken
22 with the appropriate -- there are standards in place in
23 which you -- or standards that exist in which you take
24 an externally applied time code and conform the MPEG
25 time stamps to it, so that essentially you are using the

Weiss, Merrill

1 MPEG time stamps to transport an already applied SMPTE
2 time code.

3 And so in that situation, yes, it would fall
4 within the --

5 Q If the MPEG time stamps carried a SMPTE time
6 stamp with them?

7 A Carried the information.

8 Q "The information" meaning the SMPTE time code?

9 A The time code that was already applied to the
10 data. So that it followed this -- it followed the
11 sequence of -- I probably shouldn't use the word
12 "sequence" because it will be confusing. It followed
13 the arrangement that is required by the patent, if there
14 is a particular arrangement that is required by the
15 patent. That would be a mechanism by which the MPEG
16 time information would carry the same data.

17 Q The SMPTE data?

18 A Or whatever it was.

19 Q Meaning what?

20 A Well, for instance, if it happened to have been
21 IRIG.

22 Q Okay, SMPTE or IRIG. All right.

23 A Or whatever other technique somebody chose to
24 use.

25 Q All right. And just so I'm clear then, in your

Weiss, Merrill

1 opinion, the MPEG time stamps would only fall within the
2 scope of the patent if they carried the SMPTE time code
3 information or the IRIG time code information?

4 A Or any other form of time coding -- the
5 information from any other form of time coding somebody
6 might have used. It's the information carriage that's
7 the important factor in what I'm describing.

8 Q Well, I'm -- what about MPEG time stamps by
9 themselves? Like DTS.

10 A You mean PTS?

11 Q DTS. It's my example.

12 A If MPEG time stamps are applied independently,
13 without reference to the time coding that is shown as
14 being associated with the sequence, prior to
15 compression, then that, to my way of thinking, would not
16 be a method of carriage of the same information that's
17 applied by the time encoder that's described in the
18 patent. It's a new application later in the process.
19 But there are mechanisms that are available for
20 applying -- for carriage of the time information that's
21 already associated with the content through MPEG
22 encoding.

23 Q I'm not following you so I need more clarity.
24 What about a program clock reference?

25 A PCR is not really a time stamp. It's a

Weiss, Merrill

1 You're the expert. You are the one that's going to come
2 into court and give us answers, supposedly, and
3 supposedly help the court out. I assume you're not
4 going to do that then, and I don't think you should
5 particularly be wasting everybody's time doing it now if
6 you really do have the answers, which I think you do
7 have them. Can you answer this matter-of-factly without
8 having to engage in this dilatory proceeding that we're
9 seeing?

10 A Would you like to ask a question again?

11 Q Do you remember what it was? You said the
12 difference between claim 1 and claim 7 is because
13 claim -- is because claim 1 has assignment of time
14 markers to the complete sequence of data blocks and not
15 just the ones that are part of groups, and I asked you
16 what your basis for that was.

17 A And the short answer is it's in the patent, and
18 I was trying to give you more precision as to where in
19 the patent.

20 Q All right.

21 A That's why I was looking at the document.

22 Q Look in the patent and tell me where it is.
23 Can you do that without having to read the whole thing?

24 MR. BLOCK: Objection. He just did that. He
25 told you which occurrences. It says right here what

Weiss, Merrill

1 parts of the patent.

2 BY MR. McMAHON:

3 Q Is that your answer? Because it seems to me
4 like you lost your train of thought at the end. You
5 waited so long you didn't remember what you had been
6 saying. Is your answer the one that's attributable to
7 number 25?

8 MR. BLOCK: I believe he said more than just
9 25.

10 THE WITNESS: I believe what I said to you was
11 that the basic definition was in one place and that the
12 addition of the grouping was in another place, and I
13 gave you the references to those.

14 BY MR. McMAHON:

15 Q Your answer was "in I guess it's instance or
16 occurrences as I called them, 28, 29 and 30, there is a
17 description of assigning relative time markers to the
18 audio and video data. And occurrence 25 is when the
19 description occurs of a placement into groups of
20 addressable data blocks." Is that your response to my
21 question?

22 A Yes.

23 Q And which is 25, occurrence 25 in your chart?
24 Is that the sentence that says -- well, you tell me.

25 A It's the sentence that says "time encoder 114

Weiss, Merrill

1 places the blocks of converted formatted information
2 from converter 113 into a group of addressable data
3 blocks."

4 Q And that's the sole basis for your opinion that
5 the difference between claim 1 and claim 7 is because 7
6 addresses transforms the blocks into a group of
7 addressable blocks? You're focusing on the word
8 "group," right?

9 A Yes.

10 MR. BLOCK: Objection. Mischaracterizes his
11 testimony.

12 MR. McMAHON: He just said yes.

13 Q Do still frames have to be time encoded?

14 MR. BLOCK: Objection. Vague, ambiguous.

15 THE WITNESS: It looks to me like not under all
16 of the claim.

17 BY MR. McMAHON:

18 Q Just so we're clear, I waited a minute and 58
19 seconds for that answer.

20 Going back to the time marker, how does the
21 time marker transform the blocks or frames into a group?

22 A By applying additional data to them as part of
23 the time identification.

24 Q What additional data?

25 A If we're in the SMPTE time code domain, there

Weiss, Merrill

1 are mechanisms for being able to do that.

2 Q My question is what additional data?

3 A The provision is made for carrying, as part of
4 the time code system, additional information such as,
5 for instance, scene or take or -- what else is in there?
6 Equipment. There are a variety of additional forms of
7 data that can be applied that gets carried as part of
8 the time code. And that is one mechanism that can be
9 used to indicate groups of blocks that are part of a
10 sequence.

11 Q What defines --

12 A How long did it take for that answer?

13 Q About as long, but, you know --

14 MR. BLOCK: I object. It didn't take --

15 MR. McMAHON: We'll be here as long as we want.

16 Q What defines the creation of a group?

17 A I don't remember there being any specific
18 definition of a group, other than that they can be found
19 as part of a group. In other words, whatever an
20 operator might want to associate with the group would
21 seem to me to be --

22 Q How do you know whether you are looking at one
23 group or two groups?

24 A I'm not sure I understand the question. You
25 would have data that identifies blocks as being part of

Weiss, Merrill

1 a group. Somehow I'm not understanding your question, I
2 think.

3 Q Well, maybe it's because I don't understand
4 your answer when you said, "I don't remember there being
5 any specific definition of a group, other than they can
6 be found as part of a group." This is your chance. If
7 you want to give me any other answer, then fine, but I'm
8 going to object to you telling me anything else at the
9 hearing that you're not telling me today. Do you have
10 anything else to tell me as to what defines a group?

11 A Is your question with respect to what is the
12 purpose of a group, or from a data organization
13 standpoint what is a group?

14 Q My question is what defines the creation of a
15 group?

16 A Creation of a group. The association with the
17 member blocks of that group of an indicator that they
18 are part of the group.

19 Q Give me an example.

20 A I'm going to imagine a construct to give you an
21 example. I've got an audiovisual work that has three
22 acts to it, and I want to associate some of the frames
23 with act 1, some of the frames with act 2 and some of
24 the frames with act 3. And as part of the time code
25 data I can put in an indicator that says these frames

Weiss, Merrill

1 are part of act 1, and another subset of that can be
2 associated with a code that says act 2, and another
3 subset can be associated with an appropriate code that
4 says part of act 3.

5 Q So is it correct to say that you need more than
6 merely a time marker in order to transform digital data
7 blocks into a group of addressable data blocks?

8 A No. What I was just describing is part of the
9 time code.

10 Q When you use an indicator that says these
11 frames are part of act 1 -- that's something other than
12 a time code, isn't it?

13 A It is an element of the time code.

14 Q So a time code isn't merely an hour, minute,
15 second, is it?

16 A And frames.

17 Q It's more than all four of those. Is that what
18 you're saying?

19 A It can be.

20 Q Is it within claim 7? This is your answer,
21 sir. You just talked about an indicator of which act
22 you are in. All I want to know is just tell me, as
23 precisely as you can, what is used to transform digital
24 data blocks into a group of addressable data blocks, as
25 contemplated by claim 7.

1 A. It seems to me there are two ways that can be
2 done. One is by including an indicator within the time
3 code that associates frames with parts of -- as parts of
4 groups. The other is to collect time codes that are
5 associated with frames into -- call it an external -- I
6 want to use the word database -- that indicates the
7 association between those frames.

8 Q And are either of these disclosed in the
9 specification?

10 A Not specifically. Both were known at the time,
11 well-known at the time.

12 Q You said not specifically. Was it implicitly
13 anywhere in that patent?

14 A Those were techniques that were well-known in
15 the industry in the '80s as available to do the sort of
16 thing that's being described here.

17 Q And you haven't provided us with any evidence
18 of that in your declaration report, have you?

19 A If you mean by "evidence," a reference to
20 those -- the documents that support that, no. I can
21 tell you to go look at SMPTE RP 135, if you want to see
22 where it is.

23 Q Other than what you've told me, these
24 indicators and references to time, does the time encoder
25 do anything more in claim 7?

Weiss, Merrill

1 A I'm sorry, I was thinking about something else.

2 Q Does the claim do anything more in claim 7 that
3 you haven't told us about? Let me strike that. Does
4 the time encoder do anything more in claim 7 that you
5 haven't told us about?

6 A Nothing that comes to mind at the moment.

7 Q Would you look at figure 2a in the patent?
8 What is represented by that arrow that goes across the
9 bottom?

10 A As I recollect it, that's the path that allows
11 the transfer of precompressed material coming from an
12 interlibrary data transfer into the -- if I remember
13 right, 117 prime is the storage component that's part of
14 the compressed data formatting section.

15 Q All right. New topic. What is the -- strike
16 that. Is there a distinction in the '702 patent between
17 uniform ID code and a uniform address code?

18 A I'm sorry, the noise outside was distracting.
19 Can you say that again?

20 Q Is there a distinction in the '702 patent
21 between uniform --

22 MR. BLOCK: Should be identification code, I
23 think you meant to say.

24 MR. McMAHON: Yes.

25 Q Between unique identification code --
