35 U.S.C. § 254 30

35 U.S.C. § 255 30

1 **I. INTRODUCTION**

2 This brief addresses Acacia's proposed construction of the following seven
3 claim phrases of U.S. Patent No. 6,144,702 (the '702 patent) (Exhibit 1 to Block
4 Decl.) and one claim phrase of U.S. Patent No. 5,132,992 (the '992 patent) (Exhibit 2
5 to Block Decl.):

- 6 1. "a transmission system at a first location in data communication with a
7 reception system at a second location";
- 8 2. "sequence encoder";
- 9 3. "identification encoder";
- 10 4. "transceiver";
- 11 5. "wherein said identification encoder allows entry of a popularity code";
- 12 6. "temporary storage device";
- 13 7. "digital compressor" (Claim 1 of the '702 patent), which was changed to
14 "digital decompressor" by certificate of correction; and
- 15 8. "ordering means, coupled to the conversion means, for placing the
16 formatted data into a sequence of addressable data blocks" ('992 patent -- Claim 1).

17 **II. BACKGROUND TO ACACIA'S U.S. PATENT NO. 6,144,702**

18 Acacia's U.S. Patent No. 6,144,702 (the '702 patent) is a continuation patent,
19 which claims priority from Acacia's U.S. Patent No. 5,132,992 (the '992 patent).
20 This means that the '702 patent has essentially the same specification and figures as
21 the '992 patent and has the same effective filing date as the '992 patent -- January 7,
22 1991. The only difference between the '702 patent and the '992 patent are the claims.

23 **A. The Claims Of The '702 Patent Relate To A Communication System
24 Which Comprises Both A Transmission System And A Reception
25 System**

26 The '702 patent has 42 claims, three of which are independent claims -- 1, 17,
27 and 27. Each of the claims of the '702 patent claims a "communication system,"
28 which comprises both a transmission system and a reception system. The

1 transmission system is at a first location and the reception system is at a second
2 location. The claims further define the elements contained in the transmission system
3 and in the reception system.

4 Representative claim 1 of the '702 patent is reproduced below:

5 1. A communication system comprising:

6 a transmission system at a first location in data communication
7 with a reception system at a second location, wherein said transmission
8 system comprises:

9 a sequence encoder,

10 an identification encoder, and

11 a compressed data library in data communication with said
12 identification encoder,

13 wherein said identification encoder gives items in said
14 compressed data library a unique identification code; and
15 wherein said reception system comprises:

16 a transceiver in data communication with said transmission
17 system,

18 a storage device in data communication with said
19 transceiver,

20 user playback controls in data communication with said
21 storage device,

22 a digital decompressor in data communication with said
23 storage device, and

24 a playback device in data communication with said digital
25 decompressor.

26 Claims 17 and 27 of the '702 patent are similar to claim 1 of the '702 patent in
27 that they also claim a communication system comprising both a transmission and a
28 reception system, however, claim 17 adds a number of elements not present in claim 1
and claim 27 excludes the "sequence encoder" limitation, but includes the
requirement that the identification encoder be capable of allowing entry of a
popularity code.

Unlike claim 1 of the '992 patent, none of the claims of the '702 patent use the
term "means for." There is thus no presumption that the phrases of the '702 patent
are to be construed as "means-plus-function" phrases pursuant to § 112, ¶ 6. None of
the parties have offered in their discovery responses any construction of any term or

1 phrase of the '702 patent as a "means-plus-function" or "step-plus-function" phrase
2 under § 112, ¶ 6. Thus, all of the claim terms of the '702 patent are construed using
3 the claim construction rules for conventional claim terms.

4 **B. Description Of System Elements Of The Claims of the '702 Patent**

5 Claim 1 of the '702 patent is a system claim; it lists a number of elements
6 contained in the transmission system and a number of elements contained in the
7 reception system. The transmission system and the reception system together
8 comprise the claimed "communication system." The claims state that the
9 transmission system is at a first location and the reception system is at a second
10 location. This simply means that the transmission and reception systems are at
11 different locations from each other.

12 As claim 1 is a system claim, it does not include the user or a user request -- it
13 is merely a list of the elements to be included in the transmission and reception
14 systems. Claim 1 also states that some of the elements are in "data communication"
15 with each other. This means that information is capable of being moved between the
16 various elements using any communication technique.

17 For claim 1 of the '702 patent, Acacia will provide a short description of each
18 element in a particular embodiment of the transmission system and the reception
19 system. This description of this embodiment does not limit the scope of the claims,
20 which may be broader. This description is provided for illustrative purposes only.

21 **1. The Transmission System**

22 The transmission system is shown generally in Figures 1a-1g, 2a, and 2b of the
23 '702 patent. The '702 patent specification states that the transmission system may be
24 located in one or more facilities and that the transmission system may include only
25 some of the elements shown in Figures 1a-1g, 2a, and 2b:

26 FIGS. 2a and 2b illustrate detailed block diagrams of preferred
27 implementations of the transmission system 100 of the present
28 invention. Transmission system 100 may either be located in

1 one facility or may be spread over a plurality of facilities. A
2 preferred embodiment of transmission system 100 may
3 preferably include only some of the elements shown in FIGS.
4 2a and 2b.

5 ('702 patent, 5:56-62).

6 Further, the specification makes clear that the system includes system
7 operators:

8 The storage encoding process may be run by the system
9 operator whereby the system operator accesses the master item
10 database to track and describe items stored in one or more
11 compressed data libraries.

12 ('702 patent, 10:59-63; see also, 8:29-32; 10:36-39; and 14:13-26).

13 **a) The Sequence Encoder**

14 Although the phrase "sequence encoder" is not explicitly used in the
15 specification of the '702 patent, the claims and the specification of the '702 patent
16 make clear that the "sequencer encoder" refers to the time encoder which places data
17 blocks into a sequence of addressable data blocks prior to subsequent compression:

18 As shown in FIG. 2a, the ordering means in the preferred
19 embodiment includes time encoder 114. After the retrieved
20 information is converted and formatted by the converter 113,
21 the information may be time encoded by the time encoder 114.

22 * * *

23 The sequence of addressable data blocks which was time
24 encoded and output by time encoder 114 is preferably sent to
25 precompression processor 115.

26 ('702 patent, 7:52-57; 8:46-49).

27 The specification of the '702 patent further describes the benefits of time
28 encoding prior to subsequent compression to the overall operation of the transmission

1 and reception systems, because, among other things: (1) time encoding allows users
2 to move through data in various modes by moving through frame addresses at various
3 rates ('702 patent, 8:22-24); (2) time encoding makes items and subsets of items
4 retrievable and addressable throughout the transmission system ('702 patent, 8:37-
5 39); (3) time encoding makes possible realignment of audio and video data after
6 separate audio and video compression ('992 patent, 7:60-64 and 8:9-10); and (4) time
7 encoding enables subsequent compression of the information to be improved, because
8 data reduction processes may be performed in the time dimension. ('702 patent, 8:39-
9 43).

10 **b) The Identification Encoder**

11 The identification encoder is described in the specification of the '702 patent as
12 an encoder which gives items a unique identification code and which optionally logs
13 details about the item and assigns the item a popularity code. ('702 patent, 6:31-42).
14 According to claim 1 of the '702 patent, the identification encoder gives items in the
15 compressed data library a unique identification code. According to claim 27 of the
16 '702 patent, the identification encoder allows entry of a popularity code.

17 **c) Popularity Code**

18 The popularity code represents the popularity of a particular item. It may be
19 assigned on the basis of how often the particular item is expected to be requested for
20 transmission and it may be updated to take into account how often an item is actually
21 transmitted. ('702 patent, 12:5-7; 12:13-14). The identification encoder may be used
22 to enter a popularity code for an item in the transmission system. ('702 patent, 6:35-
23 38; 12:4-5).

24 **d) The Compressed Data Library**

25 The compressed data library is a library (place or collection) in which files
26 containing the processed data for the audio and/or video information are stored before
27 being made available to one or more reception systems. The compressed data library
28 is, for example, described as being a mass storage device:

1 The compressed data storage means preferably includes
2 compressed data library 118, as shown in FIG. 2b. After the
3 data is processed into a file by the compressed data storage
4 means 117, it is preferably stored in a compressed data library
5 118. In a preferred embodiment, compressed data library 118 is
6 a network of mass storage devices connected together via a high
7 speed network. Access to any of the files stored in compressed
8 data library 118 is available from multiple reception systems
9 200 connected to the transmission and receiving system.

10 ('702 patent, 10:15-24).

11 2. The Reception System

12 The reception system is shown in Figures 1a-1g and 6 of the '702 patent.

13 a) The Transceiver

14 The transceiver is a device capable of both transmitting and receiving data. In
15 the reception system, the transceiver is described and shown as receiving the
16 information that was transmitted by the transmission system to the reception system:
17 "[t]he transceiver 201 automatically receives the information from the transmitter 122
18 as compressed formatted data blocks." ('702 patent, 17:25-27; Figure 6).

19 b) The Storage Device

20 The storage device is used to store the information received by the reception
21 system prior to play back by the user. The storage device may either store all of the
22 item received by the reception system for later viewing by the user, or it may store
23 just a portion of the item, while the system decompresses other portions of the item
24 for immediate viewing, as it is being distributed by the transmission system:

25 The reception systems 200 may either buffer¹ the requested
26 material for later viewing, or decompress in real time the

27
28 ¹ The term "buffer" is another way of saying that data is temporarily stored.
(See, IEEE Dictionary, *infra*, 5th Ed. at 135; Exhibit 11 to Block Decl.)

requested material as it is distributed by transmission system 100. Alternatively, the reception systems 200 of the present invention may perform a combination of buffering and non-buffering by buffering some of the requested material and decompressing the remainder of the requested material for immediate viewing as it is distributed by transmission system 100.

* * *

Storage 203 allows for temporary storage of the requested item until playback is requested.

('702 patent, 4:66 - 5:7 and 17:38-39; Figure 6).

c) The User Playback Controls

The user playback controls are controls in the reception system which allow the user to control the presentation of the received item:

The reception system 200 has playback controls similar to the controls available on a standard audio/video recorder. These include: play, fast forward, rewind, stop, pause, and play slow.

('702 patent, 16:55-58).

d) The Digital Decompressor

The items received by the reception system are compressed. Accordingly, they will need to be decompressed prior to playback in the decompressor. ('702 patent, 17:44-46; Figure 6).

e) The Playback Device

The playback device is the device on which the user will view or listen to the received item, such as a television or audio amplifier. ('702 patent, 17:53-54).

3. Description Of System Elements From The Figures And A Representative Claim Of The '702 Patent

The systems and methods described above are reinforced by Figures 2a, 2b, and 6 of the '702 patent, which Acacia has reproduced below. For the convenience of the Court, Acacia has color-coded Figures 2a, 2b, and 6 and the elements of representative claim 1 of the '702 patent to show the correspondence between the elements of the claim and these Figures.

Claim 1 Of The '702 Patent

1. A communication system comprising:

a [redacted] at a first location in data communication with a [redacted] reception system at a second location, wherein said [redacted] comprises:

a [redacted],
an [redacted] identification encoder, and

a [redacted] compressed data library in data communication with said [redacted] identification encoder

wherein said [redacted] identification encoder gives items in said [redacted] compressed data library a unique identification code; and

wherein said [redacted] reception system comprises:

a [redacted] transceiver in data communication with said [redacted]

a [redacted] storage device in data communication with said [redacted] transceiver,

user playback controls in data communication with said [redacted] storage device,

a [redacted] digital decompressor in data communication with said [redacted] storage device, and

a [redacted] playback device in data communication with said [redacted] digital decompressor.

C. The Prosecution History Of The '702 Patent

In construing the claims of the '702 patent, the Court must consult the prosecution history of the '702 patent.

The inventors filed the application for the '702 patent on July 23, 1998, claiming priority from a string of continuation applications back to the application which resulted in the '992 patent. No changes were made to the specification of the

1 '992 patent, other than to add a paragraph at the beginning of Column 1 showing the
2 lineage of the application, and thereby showing priority to the '992 patent filing date
3 of January 7, 1991.

4 On February 10, 1999, the inventors filed a preliminary amendment, which
5 canceled the original claims of the prior application and added claims 33-59 for
6 examination by the Patent Office. (Exhibit 3 to Block Decl.)

7 On June 22, 1999, the Patent Office issued a first substantive Office action
8 regarding its examination of pending claims 33-59. (Exhibit 4 to Block Decl.) In the
9 Office Action, the examiner rejected claims 33-37 and 41-49 as being anticipated by a
10 prior art patent to Tindell, U.S. Patent No. 5,130,792. The examiner indicated that
11 claims 38, 39, 40, and 50-59 would be allowable if the inventors made certain
12 technical changes to the claims to overcome a double patenting rejection.

13 On August 6, 1999, in response to the Office Action, the inventors amended
14 claim 33 to add the limitation that the identification encoder gives items in the
15 compressed data library a unique identification code. (Exhibit 5 to Block Decl.) The
16 inventors also added claims 60-75 (which ultimately became claims 27-42 of the '702
17 patent).

18 On October 22, 1999, the examiner rejected claims 33-75 of the application
19 over a patent to DeBye, U.S. Patent No. 5,701,582. (Exhibit 6 to Block Decl.) On
20 November 12, 1999, in response, the inventors made a showing that the DeBye
21 reference was not prior art. (Exhibit 7 to Block Decl.) On January 19, 2000, the
22 patent examiner issued another rejection of claims 33-37 and 41-49 over Walter, U.S.
23 Patent No. 4,506,387. (Exhibit 8 to Block Decl.) The examiner allowed claims 38-40
24 and 50-75.

25 On March 23, 2000, the inventors amended claim 33 (which became claim 1 of
26 the '702 patent) to include the limitation of claim 39. (Exhibit 9 to Block Decl.)
27 Claim 39 added the limitation to claim 33 that the transmission system included a
28 sequence encoder. On June 1, 2000, the examiner issued a Notice of Allowance of

1 claims 33-38, 40-46, 48, 47, 49-72, 74, 73, and 75, which were renumbered to 1-42
2 for issuance in the '702 patent. Claim 33, with the "sequence encoder" limitation,
3 became claim 1 of the '702 patent. (Exhibit 10 to Block Decl.)

4 The '702 patent issued on November 7, 2000.

5 On April 15, 2003, the Patent Office issued a Certificate of Correction
6 correcting the Patent Office's typographical error in Claim 1, which erroneously
7 included "digital compressor," instead of "digital decompressor." (Exhibit 20 to
8 Block Decl.)

9 **III. PRINCIPLES OF CLAIM CONSTRUCTION**

10 In its brief regarding the construction of the terms of the '992 patent, Acacia
11 addressed the Federal Circuit law for construing patent claims. Because the Court is
12 already familiar with the Federal Circuit law for construing patent claims, Acacia will
13 not reproduce the legal section here, but instead shall hereby incorporate by reference
14 the Principles of Claim Construction from its prior claim construction brief on the
15 terms of the '992 patent.

16 **IV. ACACIA'S CONSTRUCTION OF THE EIGHT CLAIM PHRASES AT**
17 **ISSUE**

18 **D. "A Transmission System At A First Location In Data**
19 **Communication With A Reception System At A Second Location"**

20 This phrase is found in independent claims 1, 17, and 27 of the '702 patent and
21 is comprised of the phrases "transmission system;" "reception system;" "first
22 location;" "second location;" and "data communication." Acacia will address each of
23 these phrases separately.

24 **1. "Transmission System"**

25 As with all claim terms, there is a heavy presumption that the term carries its
26 ordinary meaning. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed.
27 Cir. 2002). The Court must begin with the claim itself and determine the ordinary and
28 customary meaning of the phrase "transmission system." Arlington Industries, Inc. v.

1 Bridgeport Fittings, Inc. v. Bridgeport Fittings, Inc., 345 F.3d 1318, 1325 (Fed. Cir.
2 2003).

3 In determining the ordinary meaning of a claim term, the Court may consult
4 dictionaries, encyclopedias, and scientific treatises which were publicly available at
5 the time that the patent issued. Texas Digital Systems, Inc. v. Telegenix, Inc., 308
6 F.3d 1193, 1202 (Fed. Cir. 2002) (“When a patent is granted, prosecution is
7 concluded, the intrinsic record is fixed, and the public is placed on notice of its
8 allowed claims. Dictionaries, encyclopedias and treatises, publicly available at the
9 time the patent issued, are objective resources that serve as reliable sources of
10 information on the established meanings that would have been attributed to the terms
11 of the claims by those of skill in the art.”) The dictionary definition cannot, however,
12 contradict any definition found in or ascertained by a reading of the patent documents
13 and must be consistent with the words used by the inventors. CCS Fitness, 288 F.3d
14 at 1366; Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 n 6 (Fed. Cir.
15 1996); Texas Digital, 308 F.3d at 1204; Renishaw PLC v. Marposs Societa’ per
16 Anzioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) (“[a] common meaning, such as one
17 expressed in a relevant dictionary, that flies in the face of the patent disclosure is
18 undeserving of fealty”).

19 Where the claim term has multiple dictionary definitions, the Court must
20 identify which of the possible dictionary definitions is most consistent with the use by
21 the inventor; if more than one definition is consistent, then the Court shall construe
22 the claim term to encompass all such consistent meanings. Texas Digital, 308 F.3d at
23 1203 (“Because words often have multiple dictionary definitions, some having no
24 relation to the claimed invention, the intrinsic record must always be consulted to
25 identify which of the different possible dictionary meanings of the claim terms in
26 issue is most consistent with the use of the words by the inventor. If more than one
27 dictionary definition is consistent with the use of the words in the intrinsic record, the
28 claim terms may be construed to encompass all such consistent meanings.”); Rexnord

1 Corp. v. Laitram Corp., 274 F.3d 1336, 1343 (Fed. Cir. 2001) (where claim term had
2 two dictionary definitions, district court erred by finding claim term to be indefinite
3 and therefore not giving the term the full range of its meanings, which would
4 encompass both definitions.)

5 Looking first to the ordinary meaning, the phrase “transmission system” is
6 specifically defined in the IEEE Standard Dictionary of Electrical and Electronic
7 Terms, Fifth Edition, 1993, at p. 1405 (hereinafter “IEEE Dictionary”; Exhibit 11 to
8 Block Decl.): “In communication practice, an assembly of elements capable of
9 functioning together to transmit signal waves.”

10 The IEEE Dictionary gives further definition to the term “system”: “A
11 collection of people, machines, and methods organized to accomplish a set of specific
12 functions.” (IEEE Dictionary, at 1329).

13 Looking next to the ‘702 patent specification, these definitions for the phrase
14 “transmission system” and the term “system” are consistent with and reinforced by
15 their use by the inventors in the ‘702 patent. The transmission system is shown
16 generally in Figures 1a-1g, 2a, and 2b of the ‘702 patent.² As shown in the Figures
17 and described in the specification, the transmission system comprises a number of
18 elements (machines and methods), which function together to accomplish the purpose
19 of transmitting formatted information. The specification also states that the
20 transmission system includes system operators. (‘702 patent, 8:29-32; 10:36-39;
21 10:59-63; and 14:13-26).

22 Therefore, the definition of “transmission system,” which uses the term
23 “elements” should be further defined by the definition of “system,” which elaborates
24 on the meaning of “elements” to include “people, machines, and methods.” This
25

26
27 ² The transmission system is not limited to all of the elements shown in Figures
28 2a and 2b. The ‘702 patent specification states that the transmission system may
include only some of the elements shown in Figures 2a and 2b. (‘702 patent, 5:60-
62).

1 definition is consistent with the use of these terms by the inventors and is therefore a
2 correct construction for “transmission system.”

3 The patent specification gives additional information which further defines the
4 “transmission system.” This information is not included in the dictionary definitions,
5 but should be included in the Court’s construction. For instance, the dictionary
6 definition of “transmission system” is unclear as to where the elements of the system
7 may be located. The ‘702 patent specification clarifies the inventors’ intent -- the
8 specification states that the transmission system may either be located in one facility
9 or may be spread over a plurality of facilities. (‘702 patent, 5:58-60).

10 Thus, the phrase “transmission system” is construed as:

11 “an assembly of elements, such as people, machines, and/or
12 methods, capable of functioning together to transmit signals.
13 The transmission system may be located in one facility or may
14 be spread over a plurality of facilities.”

15 **2. “Reception System”**

16 Looking first to the ordinary meaning of the phrase “reception system,” the
17 term “reception” means: “the act of receiving.” (Webster’s Ninth New Collegiate
18 Dictionary, Merriam-Webster, Inc., at 982 (1983); Exhibit 12 to Block Decl.) Thus,
19 by analogy to the meaning of transmission system (transmitting signals), a reception
20 system receives signals. The term “system” is defined as: “A collection of people,
21 machines, and methods organized to accomplish a set of specific functions.” (IEEE
22 Dictionary, at 1329; Exhibit 11 to Block Decl.)

23 Looking next at the ‘702 patent specification, these ordinary meanings are
24 consistent with and reinforced by the specification of the ‘702 patent. The reception
25 system is shown in Figures 1a-1g and 6 of the ‘702 patent, which show the elements
26 which, in one embodiment, comprise the reception system.

27 Thus, the phrase “reception system” is construed as:
28

1 “an assembly of elements, such as people, machines, and/or
2 methods, capable of functioning together to receive signals.”

3 **3. “First Location” And “Second Location”**

4 The claim phrase states that the transmission system is at a first location and
5 that the reception system is at a second location. This means that the transmission
6 system and reception systems are at different locations. This is the definition offered
7 by defendants in their initial discovery responses (Exhibit 13 to Block Decl. at 124).

8 The relationship of the transmission system to the reception system is shown in
9 Figures 1a-1g of the ‘702 patent. In each figure, the transmission system is shown at
10 a location where there reception system is not and the reception systems is shown at a
11 location where the transmission system is not. The specification states that the
12 transmission system sends the file to “at least one remote location,” i.e., to at least one
13 reception system. (‘702 patent, 15:19-23).

14 Thus, the terms “first location” and “second location” are construed to mean
15 that the transmission system and the reception system are at different locations.

16 **4. “Data Communication”**

17 The claim states that a transmission system is in data communication with a
18 reception system.³ Other claim elements use the phrase “data communication,” in, for
19 instance, claim 1 of the ‘702 patent: the compressed data library is in data
20 communication with the identification encoder; the transceiver of the reception
21 system is in data communication with the transmission system; the storage device is

22
23 ³ The fact that the claim says that a transmission system is in data
24 communication with a reception system does not mean that this claim is limited to
25 communication systems which have only one transmission system and one reception
26 system. The claim uses the term “comprising,” which is an open-ended term meaning
27 that the claimed communication includes a transmission system and a reception
28 system and may include additional elements as well. Genentech, Inc. v. Chiron Corp.,
112 F.3d 495, 501 (Fed. Cir. 1997) (“‘Comprising’ is a term of art used in claim
language which means that the named elements are essential, but other elements may
be added and still form a construct within the scope of the claim.”) Further, the
specification discloses many embodiments of communication systems in which more
than one transmission system and/or more than one reception system. (See, e.g., ‘702
patent, Figures 1b, 1c, 1e, 1f, and 1g and 3:63 - 4:12; 4:20-61).

1 in data communication with the transceiver; the user playback controls are in data
2 communication with the storage device; the digital decompressor is in data
3 communication with the storage device; and the playback device is in data
4 communication with the digital compressor.

5 The IEEE Dictionary defines “data communication” as: “[t]he movement of
6 encoded information by means of communications techniques.” (IEEE Dictionary, at
7 305; Exhibit 11 to Block Decl.)

8 The ordinary meaning is consistent with and reinforced by the specification.
9 The patent specification shows and describes the movement of information through
10 the transmission and reception system. The compressed data library being in data
11 communication with the identification encoder is shown in Figure 2a and described at
12 6:39-47. The transceiver of the reception system being in data communication with
13 the transmission system is shown in Figures 1a-1g, 2b, and 6 and described at 15:61-
14 16:15; 16:45-17:24; and 18:3-8. The storage device being in data communication
15 with the transceiver is shown in Figure 6 and described at 18:9-21. The user playback
16 controls being in data communication with the storage device is described at 17:35-
17 43. The digital decompressor being in data communication with the storage device is
18 shown in Figure 6 and described at 18:27-35. The playback device being in data
19 communication with the digital compressor is shown in Figure 6 and described at
20 18:36-45. In each example, there is the movement of information between these
21 elements.

22 Thus, the phrase “data communication” is construed to mean “the movement of
23 encoded information by means of communications techniques.”

24 **E. “Sequence Encoder”**

25 The phrase “sequence encoder” is found in claims 1, 7, 17, and 18.

26 The term “encoder” has a well-known meaning to those of skill in the art of
27 electrical engineering, electronics, and computing. An encoder is “a device or system
28 that encodes data.” (IEEE Dictionary, at 437; Exhibit 11 to Block Decl.) An encoder

1 “may be implemented in hardware or software.” (Dictionary of Computing, 3rd Ed.
2 1990, at 155; Exhibit 14 to Block Decl.) The term “encode” is also well-known and
3 means: “(1) to express a single character or a message in terms of a code; (2) to
4 produce a unique combination of a group of output signals in response to each of a
5 group of input signals; (3) to apply the rules of a code; and (4) to represent data in
6 symbolic form using a code or a coded character set such that reconversion to the
7 original form is possible.” (IEEE Dictionary, at 436-437; Exhibit 11 to Block Decl.)⁴

8 The term “encoder” is further defined and narrowed by the term “sequence,”
9 which means “a continuous or connected series.” (Webster’s, at 1073; Exhibit 12 to
10 Block Decl.) See also, Personalized Media Communications, LLC v. International
11 Trade Commission, 161 F.3d 696, 705 (Fed. Cir. 1998) (a qualification placed upon a
12 structure narrows the scope of the structures covered by the claim: “The use of the
13 word ‘digital’ in conjunction with the word ‘detector’ merely places an additional
14 functional constraint (extraction of digital information) on a structure (detector)
15 otherwise adequately defined.”). Thus, the type of encoder disclosed in the claim is
16 an encoder which creates a sequence. The definition of encode which is most
17 consistent with creating a sequence is “to produce a unique combination of a group of
18 output signals in response to each of a group of input signals.”⁵

19 The ordinary meaning of sequence encoder is therefore a device or software
20 capable of producing a unique combination of a group of output signals in response to
21 each of a group of input signals.

22
23
24 ⁴ The term “sequencer” is another way of expressing the phrase “sequence
25 encoder.” The term “sequencer” means “any of various devices for arranging (as
26 informational items or the events in the launching of a rocket) into or separating (as
amino acids) in a sequence.” (Webster’s, at 1073; Exhibit 12 to Block Decl.)

27 ⁵ As there are multiple definitions for “encode” (and therefore multiple
28 definitions for “encoder”), the Court must identify which of the possible dictionary
definitions is most consistent with the use by the inventors. Texas Digital, 308 F.3d at
1203.

1 The Court must next examine the specification to determine whether this
2 ordinary meaning for “sequence encoder” is consistent with the patent specification.
3 The phrase “sequence encoder” is not used in the specification of the ‘702 patent⁶.
4 Instead, the ‘702 patent discloses a time encoder which places formatted data into a
5 sequence of addressable data blocks:

6 The transmission system 100 of the present invention also
7 preferably includes ordering means for placing the formatted
8 information into a *sequence* of addressable data blocks. As
9 shown in FIG. 2a, the ordering means in the preferred
10 embodiment includes *time encoder* 114.

11 * * *

12 The *sequence* of addressable data blocks which was time
13 encoded and output by *time encoder* 114 is preferably sent to
14 precompression processor 115.

15 (‘702 patent, 7:50-54; 8:46-49; emphasis added).⁷

16 The time encoder is an encoder which places blocks of converted formatted
17 information into a sequence or group of addressable data blocks by assigning relative
18 time markers to data prior to subsequent compression. (‘702 patent, 7:57-59; 8:6-9;
19 8:46-49; Fig. 2a).

20 From the specification’s explicit descriptions of the invention, the invention
21 clearly involved sequencing data blocks through time encoding and using a time

22
23 ⁶ The fact that “sequence encoder” is not used in the specification, but only
24 appears in the claims, is permissible. *All Dental Prodx, LLC v. Advantage Dental*
25 *Products, Inc.*, 309 F.3d 774, 779 (Fed. Cir. 2002), citing, *Eiselstein v. Frank*, 52 F.3d
26 1035, 1038 (Fed. Cir. 1995) (“However, the failure of the specification to specifically
27 mention a limitation that later appears in the claims is not a fatal one when one skilled
28 in the art would recognize upon reading the specification that the new language
reflects what the specification shows has been invented.”)

⁷ The specification further states that the processing includes “placing the
formatted data into a sequence of addressable data blocks by ordering means 114
(step 413c).” (‘702 patent, 18:15-19). The time encoder is indicated with reference
numeral 114 elsewhere in the patent. Step 413c in Figure 7 is “sequence data.”

1 encoder prior to subsequent compression to accomplish that task. The only sequence
2 encoder disclosed in the specification is the time encoder -- no other sequence
3 encoder or sequencing scheme is explicitly disclosed or suggested in the specification.
4 The time encoder's function disclosed in the specification is that time encoding of
5 data prior to subsequent compression. ('702 patent, 8:46-48; 18:15-25; Figures 2a
6 and 7). The inventors described numerous benefits and uses of time encoding prior to
7 subsequent compression to the overall operation of the transmission and reception
8 system. For instance, according to the specification, time encoding allows users to
9 move through data in various modes by moving through frame addresses at various
10 rates ('702 patent, 8:22-24). Time encoding makes items and subsets of items
11 retrievable and addressable throughout the transmission system ('702 patent, 8:37-
12 39). Time encoding makes possible realignment of audio and video data after
13 separate audio and video compression ('992 patent, 7:60-64 and 8:9-10). Lastly, time
14 encoding enables subsequent compression of the information to be improved, because
15 data reduction processes may be performed in the time dimension. ('702 patent, 8:39-
16 43). From the specification, it is evident that the invention is limited to time encoding
17 by a time encoder prior to subsequent compression.

18 The facts of this case are strikingly similar to those of Phillips v. AWH Corp.,
19 2004 U.S. App. LEXIS 6758 (Fed. Cir. April 8, 2004) (Exhibit 14 to Block Decl.). In
20 Phillips, the invention at issue was for vandalism-resistant building modules
21 consisting of modular wall panels. The invention is useful in the field of prison
22 construction because the panels exhibit desirable sound and fire resistance, impact
23 resistance (i.e., against bullets, bombs), and axial and lateral load bearing qualities.
24 Phillips, at *2. The claim term at issue was "baffle" in the phrase "means . . .
25 comprising internal steel baffles extending inwardly from the steel shell walls."
26 Phillips, at *2. The Federal Circuit held that this phrase was not construed as a
27 means-plus-function claim, because the term "baffles" is sufficient structure. Phillips,
28 at *10.

1 The court then construed “baffles” using ordinary claim construction rules.
2 The ordinary meaning of “baffles” is “something for deflecting, checking, or
3 otherwise regulating flow.” Phillips, *10. The court then looked to the specification
4 “to ascertain the meaning of a claim term as it is used by the inventor in the context
5 of the entirety of his invention.” Phillips, at *12, quoting, Comark Communications
6 v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). The court found the
7 specification “rife with references to impact resistance, especially against projectiles,
8 such as bullets and bombs.” Phillips, at *13. The specification further explained that
9 steel panels “form the internal baffles at angles for deflecting bullets.” Id.

10 The court therefore found that the inventors only described their invention in
11 the specification as having baffles oriented at angles other than 90 degrees and
12 therefore limited the construction of “baffles” to those which are oriented at angles
13 other than 90 degrees:

14 From the specification’s explicit descriptions of the invention,
15 we conclude that the patentee regarded his invention as panels
16 providing impact or projectile resistance and that the baffles
17 must be oriented at angles other than 90 degrees. Baffles
18 directed at 90 degrees cannot deflect projectiles as described in
19 the ‘798 patent, and, in any event, are disclosed in the prior art.

20 Phillips, at *15.

21 The court was not persuaded by the dissent-in-part, which argued that the
22 majority improperly focused on the “preferred embodiment,” because, in this case, the
23 preferred embodiment is the invention:

24 The dissent-in-part argues that we have interpreted the claims
25 erroneously by focusing only on the ‘preferred embodiment.’
26 We disagree. Inspection of the patent shows that baffles angled
27 at other than 90 degrees is the only embodiment disclosed in the
28

1 patent; it is the invention. It is impossible to derive anything
2 else from the specification.

3 Phillips, at *15.

4 Thus, even though the term “baffles” has an ordinary meaning that includes
5 baffles disposed both at 90 degrees and at angles other than 90 degrees, the court
6 nevertheless limited the construction of this term to angles other than 90 degrees,
7 because the specification made clear that this was the invention:

8 It is true that claims with the non-restrictive term ‘baffles’ were
9 allowed. However, the patent specification is intended to
10 support and inform the claims, and here it makes it
11 unmistakably clear that the invention involves baffles angled at
12 other than 90 degrees. It is in the interests of a sound patent
13 system and inventors, as well as the public, to hold inventors to
14 their disclosures.⁸

15 Phillips, at *17.

16 In this case, the ordinary meaning of “sequence encoder” includes a time
17 encoder, but could also include other sequence encoders. But, just as the only baffles
18 disclosed in the specification in the Phillips were disposed at an angle other than 90
19 degrees, in this case the only sequence encoder disclosed in the ’702 patent
20 specification is a time encoder. The description in the ’702 patent shows that the
21 inventors intended that the invention be limited to a time encoder using time encoding
22 prior to subsequent compression, because this is the only disclosure in the patent and
23

24 ⁸ Acacia’s original construction of “sequence encoder,” set forth in its original
25 discovery responses, was not limited to a time encoder. When Acacia made its
26 original discovery responses, the Phillips case had not been decided by the Federal
27 Circuit and it was not clear that a non-restrictive phrase, such as “sequence encoder,”
28 would take on a restrictive construction under the facts presented in this case. After
reading the Phillips case, which was decided on April 8, 2004, Acacia determined that
it could not support a broader construction and, therefore, on May 4, 2004, Acacia
supplemented its proposed construction to limit the construction of “sequence
encoder” to the time encoder. (See, Exhibit 15 to Block Decl.)

1 the inventors described the many benefits and uses of time encoding prior to
2 subsequent compression:

3 1. "Time encoding allows realignment of the audio and video
4 information in the compressed data formatting system 117 after separate video
5 and audio compression processing by precompression processor 115 and
6 compressor 116." ('702 patent, 8:60-64).

7 2. "Realignment of audio and video data, system addressing of
8 particular data bytes, and user addressing of particular portions of items are all
9 made possible through time encoding." ('702 patent, 8:9-12).

10 3. "Time encoding by time encoder 114 makes items and subsets of
11 items retrievable and addressable throughout the transmission system 100."
12 ('702 patent, 8:37-40).

13 4. "Time encoding enables subsequent compression of the
14 information to be improved because data reduction processes may be
15 performed in the time dimension." ('702 patent, 8:39-42).

16 These statements in the specification evidence the inventors' intent to restrict
17 the invention to time encoding by a time encoder prior to subsequent compression.⁹
18 As stated in Phillips, "[i]t is impossible to derive anything else from the
19 specification."¹⁰ Phillips, at *15.

20
21 ⁹ Because these statements in the specification evidence the inventors' intent to
22 limit the scope of the invention to time encoding by a time encoder, this case differs
23 from other recent cases in which there was no such evidence in the specification. See,
e.g., Liebel-Flarsheim Co. v. Mallinckrodt, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004);
Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002).

24 ¹⁰ The fact that the '702 patent specification describes the "time encoder" as
25 "preferred" does not mean that the claim term "sequence encoder" must be interpreted
26 as being broader than "time encoder." "The usage 'preferred' does not of itself
27 broaden the claims beyond their support in the specification. Wang Laboratories, Inc.
28 v. America Online, Inc., 197 F.3d 1377, 1383 (Fed. Cir. 1999), citing Great
American Transportation Corporation Corp. v. Cryo-Trans, Inc., 93 F.3d 766, 770
(Fed. Cir. 1996) (the teaching in the specification was "not just the preferred
embodiment of the invention; it is the only one described."); See also, Toro Co. v.
White Consolidated Industries, Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999) ("The
specification shows only a structure whereby the restriction ring is 'part of' the cover,
in permanent attachment. This is not simply the preferred embodiment; it is the only

1 Thus, the phrase “sequence encoder” is construed consistent with the scope of
2 the invention disclosed in the ‘702 patent specification as a “time encoder, i.e., a
3 device or software which places blocks of converted formatted information into a
4 sequence or group of addressable data blocks by assigning relative time markers to
5 data prior to subsequent compression.”

6 **F. “Identification Encoder”**

7 The phrase “identification encoder” is found in claims 1, 5, 6, 17, 19, 27, and
8 31 of the ‘702 patent.

9 As discussed above, the term “encoder” has a well-known meaning to those of
10 skill in the art of electrical engineering, electronics, and computing. An encoder is “a
11 device or system that encodes data.” (IEEE Dictionary, at 437; Exhibit 11 to Block
12 Decl.) An encoder “may be implemented in hardware or software.” (Dictionary of
13 Computing, 3rd Ed. 1990, at 155; Exhibit 12 to Block Decl.) The term “encode” is
14 also well-known and means: “(1) to express a single character or a message in terms
15 of a code; (2) to produce a unique combination of a group of output signals in
16 response to each of a group of input signals; (3) to apply the rules of a code; and (4) to
17 represent data in symbolic form using a code or a coded character set such that
18 reconversion to the original form is possible.” (IEEE Dictionary, at 436-437; Exhibit
19 11 to Block Decl.)

20 The term “encoder” is further defined and narrowed by the term
21 “identification,” which means “evidence of identity.” (Webster’s, at 597; Exhibit 12
22 to Block Decl.) Personalized Media, 161 F.3d at 705.

23 The ordinary meaning of “identification encoder” is therefore a device or
24 software: (1) capable of expressing a character or message (the identification of an
25 item) in terms of a code; (2) capable of producing a unique combination of a group of
26 output signals in response to each of a group of input signals; (3) capable of applying
27
28 embodiment.”)

1 the rules of a code; or (4) capable of representing data in symbolic form using a code
2 or a coded character set such that reconversion to the original form is possible.

3 As there are multiple definitions for “encode” (and therefore multiple
4 definitions for “encoder”), the Court must identify which of the possible dictionary
5 definitions is most consistent with the use by the inventors -- if more than one
6 meaning is consistent with the use by the inventors, then the claim term may be
7 construed to encompass all such consistent meanings. Texas Digital, 308 F.3d at
8 1203.

9 The specification of the ‘702 patent is consistent with and reinforces the
10 definition of encoder using the definition of encode -- “to express a single character or
11 a message in terms of a code.” The specification defines the “identification encoder”
12 as an encoder which gives [or assigns] a unique identification code to an item. (‘702
13 patent, 6:31-35: “Prior to being made accessible to a user of the transmission and
14 receiving system of the present invention, the item must be . . . given a unique
15 identification code by identification encoder 112.”; See also, 6:52-54; 6:57-58; 10:9-
16 11; 18:11-15).¹¹ Thus, the “identification encoder” expresses a message -- the unique
17 identification code.

18 Therefore the “identification encoder” is construed as “a device or software
19 capable of expressing the identification of an item in terms of a code.”

20 G. “Transceiver”

21 The term “transceiver” is found in claims 1, 17, and 27 of the ‘702 patent. A
22 transceiver is a device that is capable of both transmitting and receiving data.

23 The term “transceiver” is defined essentially the same way in at least four
24 different dictionaries:

25
26 ¹¹ The specification further defines the identification encoder to optionally log
27 details about the item (program notes) and assign the item a popularity code. (‘702
28 patent, 6:34-39; 10:45-46; 12:4-5). As part of these optional features, the
identification encoder may also map item addresses to item names and may operate a
program which updates a master item database containing facts regarding items in the
compressed data library. (‘702 patent, 10:52-58).

1 1. “A terminal device that can both transmit and receive signals.”
2 (Computer Dictionary and Handbook, Sippl and Sippl, 3rd Ed. 1980 at 594) (Exhibit
3 16 to Block Decl.);

4 2. “A terminal device that can both transmit and receive signals.”
5 (Dictionary of Information Technology, 2nd Ed. 1986, p. 341) (Exhibit 17 to Block
6 Decl.);

7 3. “*Acronym for transmitter and receiver.* A device that can both transmit
8 and receive signals on a communication medium.” (Dictionary of Computing, 3rd
9 Ed. 1990, p. 474) (Exhibit 18 to Block Decl.); and

10 4. “A device that both transmits and receives data.” (“The IEEE Standard
11 Dictionary of Electrical and Electronics Terms, 6th Ed. 1996, p. 1128) (Exhibit 19 to
12 Block Decl.)

13 The specification of the ‘702 patent is consistent with and reinforces this
14 definition. The transceiver 201 for the reception system is shown in Figure 6 of the
15 ‘702 patent. The ‘702 patent states that the transceiver 201 of the reception system
16 “automatically receives the information from the transmitter 122 as compressed data
17 blocks.” (‘702 patent, 17:25-27).

18 Transceivers are also shown in the transmission system in Figure 2b of the ‘702
19 patent. Figure 6 shows transceivers, which both transmit and receive information
20 (note the arrows both to and from the transceivers). These transceivers are shown in
21 Figure 2b as operating on communication channels, such as ISDN, B-ISDN, LAN
22 [local area network] or MAN [metropolitan area network], and telephone.

23 One district court has construed the term “transceiver” in a patent claim
24 consistent with the construction offered here by Acacia. In Inline Connection Corp. v.
25 AOL Time Warner, Inc., 302 F. Supp. 2d 307, 324-325 (D. Del. 2004), the court held
26 that the defendants failed to overcome the heavy presumption that the term transceiver
27 should not carry its ordinary meaning. Id. The court therefore construed
28 “transceiver” to mean “a device capable of both sending and receiving information.”

1 Id. The court obtained this ordinary meaning from the Dictionary of Computing (3rd
2 ed. 1991, p. 474) (Exhibit 18 to Block Decl.), cited by Acacia above. Inline
3 Connection, 302 F. Supp. 2d at 325 n 79.

4 Thus, the term “transceiver” is construed to mean “a device that is capable of
5 both transmitting and receiving data.”

6 **H. “Wherein Said Identification Encoder Allows Entry Of A Popularity**
7 **Code”**

8 The phrase “wherein said identification encoder allows entry of a popularity
9 code” is found in claims 6 and 27 of the ‘702 patent.

10 The term “popularity” means: “the quality or state of being popular.”
11 (Webster’s, at 915; Exhibit 12 to Block Decl.) The term “popular” means:
12 “frequently encountered or widely accepted; commonly liked or approved.”

13 (Webster’s, at 915; Exhibit 12 to Block Decl.) The term “code” means: “a system
14 symbols (as letters, numbers, or words) used to represent assigned and often secret
15 meanings.” (Webster’s, at 255; Exhibit 12 to Block Decl.)

16 Thus, a popularity code is the symbols, letters, or words or combinations
17 thereof used to represent the popularity of a particular item.

18 This meaning is consistent with and reinforced by the specification of the ‘702
19 patent. The ‘702 patent states that the identification encoder may also allow entry of a
20 popularity code for an item: “The storage encoding process performed by
21 identification encoder 112 also allows entry of a popularity code.” (‘702 patent, 12:4-
22 5). The ‘702 patent further states that the popularity code is assigned on the basis on
23 how often the item is expected to be requested for transmission: “The popularity code
24 is preferably assigned on the basis of how often the corresponding item is expected to
25 be requested from the compressed data library 118.” (‘702 patent, 12:5-8). Further,
26 the popularity code may be updated, to take into account how often an item is actually
27 transmitted: “Once assigned, the popularity code may be dynamically updated, by
28 factoring item usage against system usage.” (‘702 patent, 12:13-14).

1 Thus, the phrase “wherein said identification encoder allows entry of a
2 popularity code” is construed as:

3 “a popularity code is the symbols, letters, or words or combinations thereof
4 used to represent the popularity of a particular item. The identification encoder
5 allows entry of the popularity code.”

6 **I. “Temporary Storage Device”**

7 The phrase “temporary storage device” is found in claims 14 and 41 of the ‘702
8 patent. A “temporary storage device” is a device into which data may be placed,
9 retained for a limited time, and retrieved.

10 Claim 14 is dependent from claim 13, which is dependent from claim 1. Claim
11 13 adds the limitation to claim 1 that the storage device of claim 1 stores at least a
12 portion of a data file. Claim 14 adds the limitation to claim 13 that the storage device
13 is a temporary storage device.

14 Claim 41 is dependent from claim 39, which is dependent from independent
15 claim 27. Claim 39 adds the limitation to claim 27 that the storage device of claim 27
16 stores at least a portion of a data file. Claim 41 adds the limitation to claim 39 that the
17 storage device is a temporary storage device.

18 Thus, the temporary storage device of claims 14 and 41 does not need to store
19 an entire data file -- it may store only a portion of a data file.

20 The phrase “storage device” means: “a device into which data can be placed, in
21 which they can be retained, and from which they can be retrieved.” (IEEE
22 Dictionary, Sixth Edition, 1996, at 1049; Exhibit 19 to Block Decl.) Temporary
23 means: “lasting for a limited time.” (Webster’s, at 1214; Exhibit 12 to Block Decl.)
24 Thus, a temporary storage device is a device into which data may be placed, retained
25 for a limited time, and retrieved.

26 This meaning is consistent with and reinforced by the specification of the ‘702
27 patent. The ‘702 patent states that the storage device is used to store the item received
28

1 by the reception system prior to play back by the user. ('702 patent, 17:33-38 and
2 18:46-49).

3 The '702 patent discloses that the storage device may store only a portion of the
4 item received by the reception system. This occurs when the system decompresses
5 other portions of the item for immediate viewing and when the remainder of the item
6 is being received by the reception system:

7 Alternatively, the reception systems 200 of the present
8 invention may perform a combination of buffering and non-
9 buffering by buffering some of the requested material and
10 decompressing the remainder of the requested material for
11 immediate viewing as it is distributed by transmission system
12 100.

13 ('702 patent, 4:66 - 5:7 and 17:38-39; Figure 6).

14 The '702 patent uses the term "buffering." "Buffering" is simply another term
15 for storing in a temporary storage device. "Buffering" means "the process of using a
16 buffer." (IEEE Dictionary, Fifth Ed., at 135; Exhibit 11 to Block Decl.) A "buffer"
17 is: "a device in which data are stored temporarily, in the course of transmission from
18 one point to another; used to compensate for a difference in the flow of data, or time
19 occurrence of events, when transmitting data from one device to another." (Id.)

20 Thus, the phrase "temporary storage device" is construed as "a device into
21 which data may be placed, retained for a limited time, and retrieved."

22 **J. "Digital Decompressor" (Claim 1 Of The '702 Patent)**

23 Due to a Patent Office error, claim 1 of the '702 patent, as printed, included the
24 term "digital compressor" as part of the reception system. It is indisputable that this is
25 a minor typographical/clerical error by the Patent Office and that the correct term, as
26 evident by an examination of the '702 patent and its file history, is "digital
27 decompressor." The Patent Office issued a Certificate of Correction on April 15,
28 2003. (Exhibit 20 to Block Decl.).

1 Congress recognized that errors will be made in preparing patents and therefore
2 it passed two statutes which address the correction of errors -- 35 U.S.C. § 254 allows
3 for the correction of errors made by the Patent Office and 35 U.S.C. § 255 allows for
4 correction of minor errors made by the applicant. In this case, the inventors utilized
5 Section 254 (Exhibit 21 to Block Decl.) and, on April 15, 2003, obtained a Certificate
6 of Correction from the Patent Office correcting the Patent Office's
7 typographical/clerical error. (Exhibit 20 to Block Decl.).

8 Pursuant to the language of Sections 254 and 255, the Certificate of Correction
9 is only "effective for causes of action arising after it was issued." See, Southwest
10 Software, Inc. v. Harlequin, Inc., 226 F.3d 1280, 1294 (Fed. Cir. 2000). Thus, "for
11 causes of action that arise before the correction becomes effective, the patent must be
12 considered without the benefit of the certificate of correction." Novo Industries, L.P.
13 v. Micro Molds Corp., 350 F.3d 1348, 1356 (Fed. Cir. 2003). Acacia filed some of
14 the actions now pending before April 15, 2003 and filed some after April 15, 2003.
15 Thus, for the cases Acacia filed before April 15, 2003, the certificate of correction is
16 not effective, but for the cases Acacia filed after April 15, 2003, the certificate of
17 correction is effective and the term in the claim is "digital decompressor."

18 For the cases which Acacia filed before April 15, 2003, the question then
19 becomes whether the Court has the authority to correct an obvious error in a patent
20 where no certificate of correction has been issued. For minor typographical and
21 clerical errors, the Federal Circuit has held that courts can make these corrections.
22 Novo Industries, 350 F.3d at 1357, citing Lemelson v. General Mills, Inc., 968 F.2d
23 1202, 1203 n 3 (Fed. Cir. 1992) ("After the enactment of sections 254 and 255, we
24 have assumed that courts can continue to correct obvious minor typographical and
25 clerical errors in patents.")

26 For major errors, the court in Novo Industries held that:

27 A district court can correct a patent only if (1) the correction is
28 not subject to reasonable debate based on consideration of the

1 claim language and the specification and (2) the prosecution
2 history does not suggest a different interpretation of the claims.

3 Novo Industries, 350 F.3d at 1357.¹²

4 **1. The Term “Digital Compressor” Is An Obvious**
5 **Typographical/Clerical Error by the Patent Office**

6 In this case, the term “digital compressor” is an obvious typographical/clerical
7 error of the type which a court has always been able to correct. There can be no
8 reasonable debate that the correct term is “digital decompressor” and the fact that this
9 is the correct term is evident from the file history of the ‘702 patent.

10 In claim 1, the “digital decompressor” is part of the reception system. The
11 invention described in the ‘702 patent includes systems for transmitting compressed
12 audio and/or video and for receiving the video and decompressing it for playback.
13 Nowhere in the ‘702 patent is an embodiment described in which a compressor is
14 located in the reception system. This would make no sense, because compressed data
15 is being received at the reception system. There is, however, a digital decompressor
16 disclosed as part of the reception system. (‘702 patent, 17:44-52 and Figure 6).
17 Claim 1 further states that the “playback device is in data communication with said
18 digital decompressor.”

19 The inventors filed original claim 33, which issued as claim 1 of the ‘702
20 patent, in a preliminary amendment dated February 10, 1999. In claim 33, the term
21 was digital decompressor. (Exhibit 3 at p. 56 to Block Decl.). The examiner
22

23 ¹² In reaching this holding, the Federal Circuit relied on I.T.S. Rubber Co. v.
24 Essex Rubber Co., 272 U.S. 429, 442, 71 L. Ed. 335, 47 S. Ct. 136 (1926):

25 We concur in the finding of the District Judge that the omission of the
26 word “rear” was through a clerical error due to oversight, and that both
27 the counsel for the applicant and the examiner understood that it was
28 contained in claim 8 as well as the others; and we are of opinion that the
claim should be construed and have the same effect as if it had been
included. This is not in any real sense, a re-making of the claim; but is
merely giving to it the meaning which was intended by the applicant and
understood by the Examiner.

1 understood that this was the term in the claim, because in rejecting claim 33, the
2 examiner specifically pointed to a “decompressor” in the cited prior art to Tindell.
3 (Office Action dated June 22, 1999; Exhibit 4 to Block Decl., at 65).

4 In response to this Office action, the inventors amended claim 33. They did not
5 amend the “digital decompressor” term and again reproduced the term “digital
6 decompressor” in claim 33. (See, Reply and Amendment Under 37 C.F.R. § 1.111,
7 dated August 6, 1999; Exhibit 5 at p. 69 to Block Decl.). In rejecting claim 33, the
8 Examiner again specifically pointed to a “digital decompressor” in the cited prior art
9 to Walter. (Office Action dated January 19, 2000; Exhibit 8 to Block Decl., at p. 86).

10 On March 23, 2000, the inventors made another amendment to claim 33 (of
11 different portion than the digital decompressor) and again they reproduced the term
12 “digital decompressor” in claim 33. (See, Reply and Amendment Under 37 C.F.R.
13 § 1.111, dated March 23, 2000; Exhibit 9 at p. 90 to Block Decl.). There was no
14 further discussion or mention of claim 33 or the “digital decompressor” term.

15 When the Patent Office printed the ‘702 patent, the Patent Office made a
16 typographical/clerical error and changed the term in claim 33 from “digital
17 decompressor” to “digital compressor.” This was the Patent Office’s error, not the
18 inventor’s error. There can be no reasonable debate from the claim language (which
19 refers to the digital decompressor) or the specification (which discloses only a
20 decompressor in the reception system) that the correct term is “digital decompressor.”
21 The file history further shows that the inventors intended the term to be “digital
22 decompressor” and that the examiner had examined a claim having “digital
23 decompressor.” Claim 1 of the ‘702 patent, in the “playback device” element even
24 states that the playback device is in data communication with “said digital
25 decompressor,” obviously referring to the digital decompressor, which was to be
26 identified above. There is thus no doubt that this was a typographical/clerical error by
27 the Patent Office, which the Court should correct on its own. Novo Industries, 350
28 F.3d at 1357

1 Therefore, in the cases file by Acacia before April 15, 2003, the Court should
2 construe the term to be “digital decompressor,” to give the claim the meaning
3 intended by the inventors and understood by the examiner. For cases filed by Acacia
4 after April 15, 2003, the Certificate of Correction issued by the Patent Office applies
5 and the correct term is “digital decompressor.”

6 A digital decompressor is a device or software that decompresses previously
7 compressed digital data.

8 **K. “Ordering Means, Coupled To The Conversion Means, For Placing**
9 **The Formatted Data Into A Sequence Of Addressable Data Blocks”**
10 **(’992 Patent – Claim 1).**

11 The phrase “ordering means, coupled to the conversion means, for placing the
12 formatted data into a sequence of addressable data blocks” is found in claim 1 of the
13 ‘992 patent. (Exhibit 2 to Block Decl.). This phrase includes the terms “means for”
14 and therefore the phrase is presumed to be construed as a means-plus-function claim
15 element pursuant to 35 U.S.C. § 112, ¶ 6. This presumption is not rebutted and this
16 claim phrase is construed as a means-plus-function element, by first defining the
17 claimed function and then determining the structure disclosed in the specification for
18 performing this function.

19 **1. The Claimed Function -- Placing The Formatted Data Into A**
20 **Sequence Of Addressable Data Blocks**

21 The function of the ordering means is stated in the claim phrase itself --
22 “placing the formatted data into a sequence of addressable data blocks.”

23 The term “placing” means “to put in a particular state.” (Webster’s, at 897;
24 Exhibit 12 to Block Decl.)

25 The phrase “formatted data” refers to the data output from the conversion
26 means. According to claim 1 of the ‘992 patent, the conversion means places the
27 received information “into a predetermined format as formatted data.”
28

1 The construction of the phrase “sequence of addressable data blocks” is
2 discussed in detail in Acacia’s prior Markman Brief and Opposition. A sequence of
3 addressable data blocks is “a series of digital data bytes which represent frames of
4 video and/or samples of audio data wherein relative time markers assigned to the
5 audio and/or video data makes the frames of video data and/or samples of audio data
6 addressable within a particular item of information.”

7 **2. The ‘702 Patent Discloses That The Ordering Means Is A Time**
8 **Encoder**

9 The specification of the ‘702 patent discloses that the ordering means is a time
10 encoder and discloses that the time encoder performs the function of placing the
11 formatted data from the conversion means into a sequence of addressable data blocks:

12 The transmission system 100 of the present invention also
13 preferably includes ordering means for placing the formatted
14 information into a sequence of addressable data blocks. As
15 shown in FIG. 2a, the ordering means in the preferred
16 embodiment includes time encoder 114. After the retrieved
17 information is converted and formatted by the converter 113,
18 the information may be time encoded by the time encoder 114.
19 Time encoder 114 places the blocks of converted formatted
20 information from converter 113 into a group of addressable
21 blocks. The preferred addressing scheme employs time
22 encoding.

23 * * *

24 The sequence of addressable data blocks which was time
25 encoded and output by time encoder 114 is preferably sent to
26 precompression processor 115.

27 (‘992 patent, 7:59-8:2 and 8:59-62).

28

1 The '992 patent further explains that "time encoding by time encoder 114 is
2 achieved by assigning relative time markers to the audio and video data as it passes
3 from the converter 113 to the precompression processor 115." ('992 patent, 8:16-19).

4 As discussed above in Section IV. B., a time encoder is a device or software
5 which places blocks of converted formatted information into a sequence or group of
6 addressable data blocks by assigning relative time markers to data prior to subsequent
7 compression. ('992 patent, 7:59 - 8:2 and 8:16-19).

8 Thus, the "ordering means" is construed to mean "a time encoder, i.e., a device
9 or software which places blocks of converted formatted information into a sequence
10 or group of addressable data blocks by assigning relative time markers to data prior to
11 subsequent compression and all equivalents thereof."

12 3. The Construction Of "Coupled To"

13 The "ordering means" phrase also uses the phrase "coupled to" to state that the
14 ordering means is coupled to the conversion means. Claim 1 of the '992 patent also
15 states that the conversion means is coupled to the identification encoding means, the
16 compression means is coupled to the ordering means, the compressed data storing
17 means is coupled to the compression means, and the transmitter means is coupled to
18 the compressed data storing means.

19 The term "coupling" in the context of data transmission means: "the association
20 of two or more circuits or systems in such a way that power or signal information may
21 be transferred from one to another." (IEEE Dictionary, 5th Ed. at 277; Exhibit 11 to
22 Block Decl.) The phrase "coupled to" therefore means that two or more circuits or
23 systems are associated in such a way that power or signal information may be
24 transferred from one to another.

25 This meaning is consistent with and reinforced by the specification of the '992
26 patent. The '992 patent specification shows and describes that information/data is
27 transferred between the various elements of the transmission system. For instance,
28 the conversion means being coupled to the identification encoding means is shown in

1 Figure 2a and at 6:65-69. The ordering means being coupled to the conversion means
2 is shown in Figure 2a and described at 7:64-66 and 8:16-19. The compression means
3 being coupled to the ordering means is shown in Figure 2a and described at 8:59-62
4 and 9:41-42. The compressed data storing means being coupled to the compression
5 means is shown in Figure 2a and described at 10:23-26. The transmitter means being
6 coupled to the compressed data storing means is shown in Figures 2a and 2b and
7 15:55 - 16:3.

8 Thus, the term "coupled to" is construed to mean "two or more circuits or
9 systems are associated in such a way that power or signal information may be
10 transferred from one to another"

11 **V. CONCLUSION**

12 For the foregoing reasons and authorities, Acacia respectfully requests that its
13 proposed claim constructions be adopted by this Court.
