I. INTRODUCTION 1

II. ARGUMENT 2

 A. “a transmission system at a first location in data communication with a reception system at a second location” 2

 1. The Court Should Apply the Agreed-Upon Definition of “transmission system” and “reception system” and Should Not Redefine the Terms to Include People..... 2

 2. The Claims are Clear that the Transmission System Is Located “at a first location,” the Reception System Is Located “at a second location,” and They Are Not At Multiple Locations. 5

 3. The Court Should Construe “in data communication with” to Mean Connected To Allow the Transfer of Electrical Signals. 7

 B. The Limitation “identification encoder” Is Functional and Lacks Corresponding Structure in the Specification..... 8

 1. The Dictionary Definitions of “Encoder” Cited By Acacia Do Not Connote Structure. 8

 2. Acacia’s Ultimate Definition of “identification encoder”–“any device or software capable of expressing the identification of an item in terms of a code”–Is Purely Functional. 11

 C. Acacia’s Proposed Construction of “sequence encoder” Further Demonstrates that the Limitation Is Functional and Indefinite..... 12

 1. Acacia Admits That the Only Construction of “sequence encoder” Supported by the Patent Is the “time encoder.” 13

 2. The Inventors Did Not Intend To Limit “sequence encoder” to a “time encoder.” 14

 3. The Doctrine of Claim Differentiation Instructs Against Reading the Limitation of Claim 7 Into All of the Claims As Acacia Suggests. 17

1 **I. INTRODUCTION**

2 Defendants respectfully submit this brief in opposition to Acacia's proposed
3 Markman constructions for the '702 patent.

4 Having asserted its patents against plainly non-infringing technology—the
5 routine transmission of compressed video and audio over the Internet—Acacia's
6 latest claim construction brief continues its pattern, born out of necessity, of treating
7 its patent claims as the proverbial "nose of wax." In its brief, Acacia proffers a view
8 of the '702 patent that, if adopted, would require this Court to variously: 1) eliminate
9 or change words in the claims (e.g., changing "at a first location" to "at one or more
10 locations"); 2) equate the term "sequence encoder" with "time encoder," despite the
11 inventors never having used the former, while having repeatedly used the latter; and
12 3) violate decades-old Supreme Court precedent against the use of "functional
13 claiming."

14 This Court should reject Acacia's approach to claim construction. As just one
15 stark example of the lengths to which Acacia will go to achieve a desired result, we
16 note that with respect to the phrase "sequence encoder" in the '702 patent and the
17 "ordering means" limitation of the '992 patent, Acacia posits an argument that is the
18 precise opposite of arguments advanced to the European Patent Office about the
19 European counterpart patent to the patents-in-suit. Whereas here, Acacia contends
20 that the "invention" of the '992 and '702 patents was limited to "time encoding" and
21 that it would be "impossible" to draw any other conclusion from the patent
22 specification, at the EPO, the inventors took a decidedly different view:

23 Whilst it is true that data may be time stamped, this is only stated to be a
24 preferred embodiment (page 12, line 34). The skilled reader would be
25 able to envisage other means of encoding the data such that "ordering
26 means" could rearrange or shuffle it into a sequence of addressable data
27 blocks. Indeed, it may not even be necessary to encode the data at all.
28 All that is necessary, and as is defined in the claim, is that the ordering

1 means places the formatted data into a sequence of addressable data
2 blocks. We believe that part of the objection arose from the fact that the
3 claims specified “ordering means” which was erroneously labeled
4 “(114)”. This is incorrect – the ordering means may simply include, in
5 the preferred form, the time encoding (114).

6 (Miller Decl., Ex. OO at 136.)

7 We urge the Court not to let Acacia dispense with these and other statements
8 made by the inventors in favor of its result-driven approach devised a decade after the
9 fact. Defendants respectfully request that the Court construe the claims consistent
10 with the intrinsic evidence as set forth herein.

11 **II. ARGUMENT**

12 **A. “a transmission system at a first location in data communication**
13 **with a reception system at a second location”**

14 **1. The Court Should Apply the Agreed-Upon Definition of**
15 **“transmission system” and “reception system” and Should**
Not Redefine the Terms to Include People.

16 As set forth in Defendants’ opening brief, the construction of “transmission
17 system” is simple and straightforward. The IEEE dictionary defines “transmission
18 system” as “an assembly of elements capable of functioning together to transmit
19 signal waves.” (Ex. NN at 575.) This definition is consistent with the term’s use in
20 the claims, written description, and prosecution history of the ‘702 patent.

21 Accordingly, “transmission system” may be given the common dictionary meaning.

22 *ACTV, Inc. v. Walt Disney Co.*, 346 F.3d 1082, 1091 (Fed. Cir. 2003).

23 Acacia does not dispute the propriety of the agreed-upon IEEE definition, as it
24 was also used by Acacia to form its proposed construction. (*See* Pl.’s Br. at 14.)

25 Rather, Acacia newly contends that the Court must further define the term “elements”
26 employed in the IEEE definition of “transmission system” to include “people,
27 machines, and methods,” through the use of a separate cherry-picked definition of the
28

1 word “system” (divorced from the phrase “transmission system”).¹ (*Id.*) The Court
2 should reject this approach.

3 At the outset, there is no need for the Court to define the term “elements”
4 within the agreed-upon definition of the phrase “transmission system”—the claims of
5 the ‘702 patent all provide elements of the claimed transmission system. Each of the
6 ‘702 patent claims recite the phrase “wherein said transmission system comprises”
7 and proceed to list the claimed elements of the transmission system. Accordingly, the
8 Court need not define the “assembly of elements” in the IEEE definition—the claims
9 already do it.

10 But this entirely proper approach does not suit Acacia’s needs because this
11 construction of “transmission system” does not include humans, which Acacia needs
12 to get into the claims, not for the ‘702 patent, but for the ‘992 patent. Put simply, the
13 construction offered by Acacia is a back-door effort to convince the Court to put
14 human beings into the claims of the ‘992 patent. As part and parcel of this effort,
15 Acacia devises a theory to incorporate a definition for “system” into the construction
16 of “transmission system” so that the latter may include humans. This theory, to the
17 extent it can be understood, goes something like this:

- 18 • In the IEEE dictionary, the term “system” has 19 different definitions
19 relating to various fields in the electronic arts. One of these
20 definitions—the tenth definition relating to software—includes an
21 unexplained reference to humans. It provides: “a collection of people,
22

23 ¹ Acacia’s construction is plainly an attempt to support its infringement theory
24 under the ‘992 patent, which is dependent on human beings providing
25 corresponding “structure” to “means” limitations in claim 1 and performing
26 certain steps of method claims (claim 41) that the claims expressly state must be
27 performed by a “transmission system.” Even putting aside the legal impropriety
28 of these arguments, addressed in detail in Defendants’ previous briefs and
argument, the patentees disclaimed “manual” transmission systems—to the extent
such a thing even exists—in their arguments over the Fenwick reference. (*See Ex.*
B at 159.)

1 machines, and methods organized to accomplish a set of specific
2 functions.” (Block Decl. Ex. 11 at 1329.)

- 3 • The IEEE definition of “transmission system” requires that a
4 transmission system include a number of “elements.”
- 5 • “Elements” are “machines and methods.” (Pl.’s Br. at 14.)
- 6 • Because the patent specification states that a system operator interacts
7 with the system to perform certain processes, the “elements” of the
8 transmission system must include a person, as opposed to simply
9 operating the way the patent states—via, in part, human interaction—
10 which is no different than the way most apparatuses or systems operate.
11 *Compare Overhead Door Corp. v. Chamberlain Group, Inc.*, 194 F.3d
12 1261, 1270 (Fed. Cir. 1999) (noting that a mechanical switch would
13 necessarily require a human operator).
- 14 • Accordingly, the term “elements” in the IEEE definition of
15 “transmission system” must be “further defined by the definition of
16 ‘system,’ which elaborates on the meaning of elements to include
17 ‘people, machines, and methods.’” (Pl.’s Br. at 14-15.)

18 This approach to claim construction—devising a construction to suit an
19 infringement theory, cherry-picking definitions, and crafting ambiguity where it does
20 not exist—is manifestly improper and demonstrates again the result-oriented
21 approach to claim construction proffered by plaintiff.

22 Indeed, we note that this approach is driven solely by Acacia’s wish to have
23 human beings be a part of the claimed transmission system, and not by any genuine
24 ambiguity in the claims. But, to date, Acacia has not been able to cite a single case
25 where a human was construed to be a structure. Beyond the myriad of other reasons
26 cited by defendants, the reason for its failure is further evident from 35 U.S.C. § 101,
27 which defines a patentable subject matter. Section 101 provides:

1 The claim language requires that the transmission system be “at a first
2 location” and the reception system be “at a second location.” Notably, the claim uses
3 the singular form of the term “location” and not the plural form “locations.” It also
4 specifies that the transmission systems is “at” “a first location,” while the receiving
5 system is “at” “a second location.”

6 Accordingly, the claim language requires that the systems be at one (singular)
7 location. After giving lip-service to the truism that “the Court must begin with the
8 claim itself,” *see* Pl.’s Br. at 12, Acacia simply ignores the claim language—failing to
9 mention the word “at” in its entirety—and instead looks to the dictionary definition of
10 “transmission system,” and magically concludes that the definition “is unclear as to
11 where the elements of the transmission system may be located.” (*Id.* at 15.) Based
12 on this false premise, Acacia turns to the patent specification and asserts that “the
13 transmission system may either be located at one facility or may be spread over a
14 plurality of facilities.” (*Id.*)

15 But under Acacia’s construction, the systems are not required to be “*at a first*
16 *location*” or “*at a second location*” as stated in the claims. The claim limitation is
17 satisfied so long as the transmission system is at any of a number of “facilities” that
18 are different from the reception system “facilities.” Such a construction effectively
19 reads out the claim limitation at issue and is legally impermissible. *Ethicon Endo-*
20 *Surgery, Inc. v. U.S. Surgical Corp.*, 93 F.3d 1572, 1582 (Fed. Cir. 1996); *Exxon*
21 *Chemical Patents, Inc. v. Lubrizol Corp.*, 64 F.3d 1553, 1557 (Fed. Cir. 1995)
22 (recognizing that “[w]e must give meaning to all the words in [the] claims”).
23 Moreover, it reads back into the claims the ability of the transmission and reception
24 systems to be at more than one location, which was disclosed in the patent
25 specification, but was not claimed—and consequently—dedicated to the public. *See*
26 *Johnson & Johnson Assoc., Inc. v. R.E. Services*, 285 F.3d 1046, 1054 (Fed. Cir.
27 2002).

28

1 Likewise, Acacia's definition of "location," which is essentially one or more
2 facilities, conflicts with the meaning of the term given both in the patent and during
3 the prosecution of the '720 patent. The applicants equated a "premises" with a
4 "location" in distinguishing the Walter patent in the background of the patent. ('702
5 patent at 1:30-37.) Later, in response to a rejection by the examiner during the
6 prosecution of the '720 patent, the applicants reaffirmed the meaning given to the
7 term in the patent by stating that "Applicants have used the term "location" to refer to
8 a premises, rather than merely a space in a particular structure." (Ex. HH at 440.)
9 Thus, "location" should be construed to be a premises and not one or more facilities.

10 Accordingly, the Court should construe the phrases "at a first location" and "at
11 a second location" to mean that the transmission system is located within (or "at") a
12 single premises, while the reception system is located within (or "at") a single,
13 different premises than the transmission system.

14
15 **3. The Court Should Construe "in data communication with" to
Mean Connected To Allow the Transfer of Electrical Signals.**

16 For its construction of "data communication," Acacia adopts the first definition
17 for the term in the IEEE dictionary, which is "the movement of encoded information
18 by means of communication techniques." (Pl.'s Br. at 16-17.) Although the IEEE
19 dictionary provides guidance, the definition is not particularly useful because it
20 provides less clarity than the phrase "in data communication with." Instead, it
21 introduces new terms and phrases that convey almost no meaning, such as the phrase
22 "by means of communication techniques." This phrase could conceivably cover any
23 form of communication available—even sending "encoded information" via the
24 United States Postal Service.

25 As set forth in Defendants' opening brief, all forms of "communication"
26 described in the patent involve the exchange of electrical signals. Accordingly, the
27 limitation "in data communication with" should be construed to mean connected to
28 allow the transfer of electrical signals.

1 **B. The Limitation “identification encoder” Is Functional and Lacks**
2 **Corresponding Structure in the Specification.**

3 Far from saving this term from the validity problems identified by Defendants
4 in connection with the ‘992 patent, Acacia’s proposed construction of “identification
5 encoder” only amplifies these concerns and firmly establishes that the term is purely
6 functional and does not connote structure. The claims that employ this limitation are
7 invalid as indefinite for failing to identify corresponding structure in the patent
8 specification pursuant to 35 U.S.C. § 112, ¶ 6.

9 **1. The Dictionary Definitions of “Encoder” Cited By Acacia Do**
 Not Connote Structure.

10 The patent specification does not describe what an “identification encoder” is
11 or how it performs the functions set forth in the claims of the ‘702 patent. The reason
12 is simple. The term was coined by the named inventors to describe the function being
13 performed—the “identification encoding process.” (‘702 patent at FIG. 2a, element
14 112.)

15 In the absence of any disclosure of structure in the patent, Acacia looks to a
16 variety of dictionary definitions of “encoder” and “encode” to concoct structure to
17 satisfy the requirements of § 112, ¶ 2. Not only do Acacia’s proffered definitions fail
18 to provide structure, they actually confirm that the term “encoder” is functional, and
19 thus cannot rescue the claims.

20 As it did during the construction of the “identification encoding means”
21 limitation of the ‘992 patent, Acacia cites the IEEE dictionary, which defines
22 “encoder” as “a device or system that encodes data.” (Pl.’s Br. at 24.) As set forth in
23 Defendants’ brief, “device” and “system” are generic structural terms that are not a
24 sufficient recitation of structure. *Personalized Media Communications, LLC. v. ITC*,
25 161 F.3d 696, 704 (Fed. Cir. 1998) Apparently now accepting this fact, Acacia
26 abandons the construction of “identification encoder” that it advanced during the
27 construction of the ‘992 patent—“a *device* capable of expressing a number, symbol,
28 or name that uniquely identifies certain information—and now turns to a new

1 dictionary and new “structure” in a strained effort to save its claims: the *Dictionary*
2 *of Computing*.

3 At the outset, we note that there has been no showing that the specialized
4 *Dictionary of Computing* is proper evidence for the Court to use. The patent
5 specification makes no reference to software or computers with respect to the
6 “identification encoder.” But even if employed, the newly cited *Dictionary of*
7 *Computing* is of no help. This dictionary sets forth two definitions of “encoder.” The
8 first definition, which Acacia has adopted in part, states that an “encoder” is “the
9 means by which an encoding process is affected (*see code*). It may be implemented
10 in hardware or software, the process being algorithmic in nature.” (Block Decl. Ex.
11 14 at 155.) This definition introduces two generic structural terms, “means” and
12 “hardware,” that are not connotative of any particular structure—these words are
13 simply the same as “device.” *Personalized Media*, 161 F.3d 704. The definition also
14 recites the term “software,” which Acacia has incorporated into its construction and
15 relies on for structure. However, the inclusion of the word “software,” standing
16 alone, does not provide any more structure than the terms “device” and “system.”

17 The term “software” has no structural meaning separate from the algorithm that
18 it embodies. *WMS Gaming, Inc. v. Int’l Game Tech.*, 184 F.3d 1339, 1349 (Fed. Cir.
19 1999) (stating that a general purpose computer executing software is not permissible
20 corresponding structure, rather the computer with the associated algorithm is
21 required); *Overhead Door*, 194 F.3d at 1271-73 (noting software algorithm in FIG. 3
22 of the patent as corresponding structure). Indeed, as the definition in the *Dictionary*
23 *of Computing* explains, and as Acacia conveniently leaves out, the encoding process
24 is “algorithmic in nature.” (Block Decl. Ex. 14 at 155.) Without the disclosure of an
25 associated algorithm, “software” does not connote any structure at all.

26 A review of the patent claims and specification demonstrates that no algorithm
27 is disclosed. The term “identification encoder” is found in claims 1, 5, 6, 17, 19, 27,
28 and 31 of the ‘702 patent. Some of the claims recite the function being performed by

1 the “identification encoder.” The function recited in the claims is not an algorithm.
2 Other claims specify only the other claim elements with which the “identification
3 encoder” is in “data communication,” and thus also fail to provide an algorithm. The
4 specification fares no better—it restates the function of the “identification encoder,”
5 but does not describe how the function is performed. Because the patent does not
6 recite an algorithm, the term “software,” which itself is not in the patent, but only in
7 the new dictionary found by Acacia, cannot satisfy the structural limitation. Absent
8 some non-functional limitation to the software in the patent specification—and no
9 one has identified one to date—the definition is of no help to Acacia.

10 Accordingly, an “encoder” is a generic term not connotative of any particular
11 structure, and redefining it as “hardware or software” is no better. Similarly
12 unpersuasive is Acacia’s resort to the definition of the word “encode,” a clearly
13 functional term. As noted by Acacia, the IEEE dictionary provides four definitions of
14 the term “encode.” (Pl.’s Br. at 24.) In turn, Acacia creates four “ordinary
15 meanings” of identification encoder by sticking the phrase “a device or software
16 capable of” before each of the dictionary definitions. (*Id.* at 24-25.) According to
17 Acacia, “there are multiple definitions for ‘encode’ (and therefore multiple
18 definitions for ‘encoder’).” (*Id.* at 25.)

19 But this argument only serves to prove Defendants’ point—that the term
20 “encoder” has no meaning outside of its function. Depending on what function the
21 encoder is to perform, the “encoder,” according to Acacia, would have a different
22 “structure.” But this is precisely what the bar against functional claiming is designed
23 to prevent—the claiming of all devices that perform a particular function, as opposed
24 to the more narrow claiming style permitted under 35 U.S.C. § 112, ¶ 6. Given the
25 complete lack of any structure in the patent specification—hardware or software—the
26 claim term fails.

27
28

1 2. **Acacia’s Ultimate Definition of “identification encoder”—“any**
2 **device or software capable of expressing the identification of**
3 **an item in terms of a code”—Is Purely Functional.**

3 After creating the four “ordinary meanings” for “identification encoder,”
4 without explanation, Acacia excludes three of the “ordinary meanings” and selects
5 the first definition of encode, which is “to express a single character or a message in
6 terms of a code.”² (*Id.*) Using this definition of “encode,” Acacia construes the
7 “identification encoder” as “a device or software capable of expressing the
8 identification of an item in terms of a code.”³ (*Id.*)

9 Again, this is purely functional claiming—the word “device” is no different
10 than the word “means,” and, absent some limiting algorithm, the term “software” is
11 generic as well, even were the Court to grant that “software” is supported by the
12 patent specification, which it is not. As noted before by Defendants, the only
13 mention of the term “software” in the patent specification is the now oft-argued
14 source material library utilization software, which even Acacia does not claim is
15 linked to the function of the “identification encoder.”

16 Indeed, applying Acacia’s claim construction methodology to the other
17 functions allegedly performed by the “identification encoder” provides even further
18 proof that the term has no well-understood meaning connotative of structure.
19 Acacia’s construction of “identification encoder” is a device or software that encodes
20 a unique identification code. (*Id.*) But the claims of the ‘702 patent indicate that it
21 does more than that. The claims also require the “identification encoder” to “allow
22

23 ² In its Opposition Brief for the ‘992 patent, Acacia defined “identification encoder”
24 using one of the excluded definitions “to apply the rules of a code.” (Pl.’s Opp’n
25 Br. at 24.) Apparently, the meaning of “identification encoder” in the ‘702 patent
26 is different from its meaning in the ‘992 patent.

26 ³ The patent does not disclose a single embodiment of this in the patent
27 specification. Were the Court to adopt such a construction, the claim would
28 clearly be invalid for lack of enablement. *Durel Corp. v. Osram Sylvania, Inc.*,
256 F.3d 1298 (Fed. Cir. 2001) (“to be enabling, the specification must teach those
skilled in the art how to make and use the *full scope* of the claimed invention
without undue experimentation.”)

1 entry of a popularity code.” Indeed, claim 6 requires that the “identification encoder”
2 perform both functions.

3 Under Acacia’s theory, merely placing the function before the word “encoder”
4 creates a well-understood “structure” that is distinguished by the particular function
5 performed. Thus, if Acacia’s theory holds together, in view of the ‘702 patent, one of
6 skill in the art must understand that the term “popularity encoder” connotes a
7 “structure” identical to the term “identification encoder,” since the same structure, the
8 “identification encoder,” allows entry of both a “unique identification code” and “a
9 popularity code.” (*Compare* claims 1 and 6.) The patent specification also refers to
10 the process of assigning a unique identification code and popularity code as “storage
11 encoding.” (‘702 patent at 6:35-39.) Thus, under Acacia’s theory, the term “storage
12 encoder” must also bring to mind the identical “structure” to one of skill. Yet, the
13 functional word that precedes “encoder” in each term states a different function, and
14 under Acacia’s main theory, would connote different “structure.”

15 Under Acacia’s flawed reasoning, any functional word found in the patent, or
16 even terms that are not used in the patent (*see* “sequence encoder), could be placed in
17 front of the word “encoder” to define a structure. Such a result is impermissible.
18 Absent some limiting structure in the patent specification—either actual hardware or
19 a software algorithm—that allows the term to be construed under 35 U.S.C. § 112, ¶
20 6, the use of the generic term “identification encoder” is not permitted under the
21 Patent Act. Because there is no corresponding structure to this functional term, the
22 “identification encoder” claim limitation fails.

23
24 **C. Acacia’s Proposed Construction of “sequence encoder” Further
Demonstrates that the Limitation Is Functional and Indefinite.**

25 During discovery, Acacia construed the term “sequence encoder” to mean “a
26 device capable of translating data into a defined set of symbols.” (Miller Decl.,
27 Ex. PP at 452.) Acacia advanced this construction despite the fact that “sequence
28 encoder” is not used in the patent and has no well-understood meaning connotative of

1 structure. Recognizing that the functional term “sequence encoder” either cannot
2 satisfy the definiteness requirement or, as is conceded in its brief, is not enabled to its
3 full scope, Acacia now takes a different position. Citing a recent Federal Circuit
4 decision, *Phillips v. AWH Corp.*, 2004 U.S. App. LEXIS 6758 (Fed. Cir. April 8,
5 2004),⁴ Acacia advances a new construction in which the term “sequence encoder” is
6 replaced with “time encoder.” (Pl.’s Br. at 24.) The Court should not indulge
7 Acacia’s request to rewrite the claims to preserve their validity. The Court should
8 construe the claims as written and find claims 1, 17, 18, and 32 invalid pursuant to §
9 112, ¶ 2. Further, the Court should construe dependent claims 7 and 33 in accordance
10 with the algorithm of the “time encoder” set forth in the patent’s specification.

11
12 **1. Acacia Admits That the Only Construction of “sequence encoder” Supported by the Patent Is the “time encoder.”**

13 The term “sequence encoder” does not appear in the dictionary and has no
14 well-understood meaning to those of skill in the art connotative of structure. It is a
15 functional term coined by the applicants years after the specification was written and
16 submitted to the USPTO. Indeed, the only mention of the word “sequence” appears
17 in the discussion of the “ordering means,” which describes a “time encoder” that
18 performs an algorithm to place information (i.e., formatted data) into a sequence of
19 addressable data blocks. (‘702 patent at 7:50-52.)

20 Acacia does not dispute this fact. It admits “[t]he only sequence encoder
21 disclosed in the specification is the time encoder – no other sequence encoder or
22 sequencing scheme is explicitly disclosed or suggested in the specification.” (Pl.’s
23 Br. at 20.) Indeed, Acacia devotes numerous pages of its brief demonstrating how the
24

25 ⁴ Acacia builds up this case as if it turned the law of claim construction on its head.
26 The result in *Phillips* is neither new, nor unusual. In the past, the Federal Circuit
27 has limited the claims to an embodiment disclosed in the specification on the
28 precise grounds of *Phillips*. See e.g., *SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc.*, 242 F.3d 1337 (Fed. Cir. 2001). Indeed, buried in a later footnote, Acacia trumpets this fact, putting the lie to the argument that *Phillips* somehow represents some new state of the law.

1 patent cannot support a construction that is broader than “time encoder.” (*See id.* at
2 19-24.) Or as Acacia says, “it is impossible to derive anything else from the
3 specification.” (*Id.* at 23.)

4 Although the parties agree that the only disclosure that even relates to a
5 “sequence encoder” is the “time encoder,” the parties propose two vastly different
6 approaches to the construction of the disputed term. Acacia asks the Court to simply
7 replace “sequence encoder” with “time encoder” in all of the claims. Acacia’s
8 construction, however, disregards the inventors’ intent to claim a broad, albeit
9 unsupported, definition of sequence encoder and the dependent claims specifically
10 directed to the time encoding process. Thus, Acacia’s approach should be rejected by
11 the Court.

12 **2. The Inventors Did Not Intend To Limit “sequence encoder” to**
13 **a “time encoder.”**

14 Throughout its brief, Acacia asserts that the inventors intended to limit the
15 scope of the term “sequence encoder” to “time encoder.” In an obvious attempt to
16 portray the facts of this case to be “strikingly similar” to the facts of *Phillips*, Acacia
17 points out that the only “sequence encoder” disclosed in the patent is the “time
18 encoder” and that “the inventors described the many benefits and uses of time
19 encoding... .” (*Id.* at 22-23.) However, the claims, specification, and prosecution
20 history of a related European patent demonstrate that the inventors had no such intent.

21 The first patent application in the Yurt family, filed on January 7, 1991,
22 included the same description of the “time encoder” that appears in the ‘702 patent.
23 Thus, from the very first filing, the named inventors had used the term “time
24 encoder” to describe a specific function being performed in the transmission system.
25 After nearly a decade had passed and at least three patents in the family had issued,
26 the named inventors submitted claims to the USPTO reciting, for the first time, the
27 term “sequence encoder.” Had the inventors intended to limit their claims to “time
28 encoder,” as Acacia suggests, they would have simply used that term in the claim.

1 The fact that they chose to use a different term suggests that they intended a different
2 meaning.

3 The claims also support this conclusion. Claim 1 of the '702 patent recites "a
4 sequence encoder," but does not indicate the function it performs or how it is
5 connected to the other elements of the claimed transmission system. The inventors
6 included claim 7, which depends from claim 1, to further define the communication
7 system by providing the additional limitation "wherein said sequence encoder
8 transforms digital data blocks into a group of addressable data blocks." The patent
9 indicates that "[t]ime encoder 114 places the blocks of converted formatted
10 information from the converter 113 into a group of addressable data blocks." ('702
11 patent at 7:57-59.) The patent further states that "[t]he sequence of addressable data
12 blocks which was time encoded and output by time encoder 114 is preferably sent to
13 precompression processor 115." (*Id.* at 8:46-49.) The existence of claim 7 indicates
14 that the inventors intended claim 7 to cover a "time encoder" with its associated
15 algorithm and intended claim 1 to have a broader meaning.

16 A review of the specification also confirms that the inventors intended a
17 broader meaning. The source material library of the transmission system is disclosed
18 to include various types of information, including still pictures, books, documents,
19 and other physical objects. ('702 patent at 6:7-11.) These types of materials do not
20 contain audio or video information, and thus would have no use for the "time
21 encoding" process. Therefore, limiting "sequence encoder" to "time encoder" would
22 exclude disclosed embodiments of the transmission system.

23 Moreover, the named inventors explained that the "ordering means" should not
24 be equated to a "time encoder" during the prosecution of a related European patent.
25 In January 1992, the applicants filed a patent application with the European Patent
26 Office (EPO) with claims nearly identical to the '992 patent. Notably, claim 1 of the
27 EPO application, like claim 1 of the '992 patent, included an "ordering means (114),
28 coupled to the conversion means (113) for placing the formatted data into a sequence

1 of addressable data blocks.”⁵ (Miller Decl., Ex. OO at 171.) The EPO rejected claim
2 1 for a lack of clarity and support from the written description, and commented:

3 “ordering means” – this wording implies some form of rearrangement or
4 shuffling in time of data. In at least some of the embodiments this
5 appears not to be the case – one described technique being the insertion
6 of data corresponding to a time-code

7 *Id.* at 160.

8 In response to the EPO’s objections for lack of clarity, the applicants explained
9 that the “ordering means” should not be limited to the “time encoder”:

10 The term “ordering means” is also believed to be clear. Whilst it is true
11 that data may be time stamped, this is only stated to be a preferred
12 embodiment (page 12, line 34). The skilled reader would be able to
13 envisage other means of encoding the data such that “ordering means”
14 could rearrange or shuffle it into a sequence of addressable data blocks.
15 Indeed, it may not even be necessary to encode the data at all. All that is
16 necessary, and as is defined in the claim, is that the ordering means
17 places the formatted data into a sequence of addressable data blocks. We
18 believe that part of the objection arose from the fact that the claims
19 specified “ordering means” which was erroneously labeled “(114)”. This
20 is incorrect – the ordering means may simply include, in the preferred
21 form, the time encoding (114). We wish to delete the reference numeral
22 (114) from claims 1 and 12, therefore, and the Examiner is requested to
23 do so in manuscript.

24 *Id.* at 136.

25 The ‘702 patent claims, the specification, and statements by the inventors all
26 demonstrate the inventors’ intent not to limit “sequence encoder” to “time encoder.”

27 _____
28 ⁵ The European Patent Office requires the structures in the claims to be labeled with
the corresponding numbers from the patent’s figures.

1 Accordingly, the Court need not and should not rewrite the claims.

2 **3. The Doctrine of Claim Differentiation Instructs Against**
3 **Reading the Limitation of Claim 7 Into All of the Claims As**
4 **Acacia Suggests.**

5 As set forth previously, claim 7 of the '702 patent further limits the scope of
6 the claim 1 "sequence encoder" by ascribing the exact function of the "time encoder"
7 disclosed in the patent. Under the doctrine of claim differentiation, each claim in a
8 patent is presumptively different in scope. *Wenger Mfg. v. Coating Mach. Sys.*, 239
9 F.3d 1225, 1233 (Fed. Cir. 2001). "This presumption is especially strong where there
10 is a dispute over whether a limitation found in a dependent claim should be read into
11 an independent claim, and that limitation is the only meaningful difference between
12 the two claims." *Ecolab, Inc. v. Paraclipse, Inc.*, 285 F.3d 1362, 1375 (Fed. Cir.
13 2002) ("Because the only meaningful difference between claims 16 and 17 is the
14 limitation ultraviolet light, under the doctrine of claim differentiation, claim 16 does
15 not require ultraviolet light."); *see also Sunrace Roots Enterprise Co. v. SRAM Corp.*,
16 336 F.3d 1298, 1303 (Fed. Cir. 2003) (rejecting a construction that would render an
17 independent claim redundant).

18 Here, the only meaningful difference between claim 1 and claim 7 is a
19 recitation of the function performed by the "time encoder" during the time encoding
20 process. Acacia's proposed construction would render claim 7 superfluous, and is
21 therefore improper. *Wenger*, 239 F.3d at 1233.

22 Indeed, Acacia's strained efforts to equate "sequence encoder" and "time
23 encoder" is nothing more than a naked attempt to save the claim from its readily
24 apparent invalidity. In its brief, Acacia concedes that the term "sequence encoder" is
25 broader than a "time encoder." (Pl.'s Br. at 22) At the same time, Acacia
26 acknowledges that only one embodiment is disclosed—the time encoder. (*Id.*) These
27 concessions render the patent invalid, either under § 112, ¶ 2 for indefiniteness or §
28 112, ¶ 1, for failure to enable the full scope of the claims.

1 It is not for this Court, despite the admonitions of the Federal Circuit to attempt
2 to construe claims to preserve validity, to save these claims in the manner proposed
3 by Acacia. The Court should construe the claims as written and find claims 1, 17, 18,
4 and 32 invalid pursuant to § 112, ¶ 2. Further, the Court should construe dependent
5 claims 7 and 33 in accordance with the algorithm of the “time encoder” set forth in
6 the specification.

7
8 **D. The Court Should Reject Acacia’s Broad, Infringement-Inspired
Construction of the “popularity code” Limitation.**

9 Acacia’s proposed construction of the phrase “wherein said identification
10 encoder allows entry of a popularity code” is so broad and meaningless that it
11 effectively eliminates the limitation from the claim. Acacia’s motivation is obvious.
12 Most parties transmitting video and audio on the Internet do not actually use
13 “popularity codes.” But Acacia does not let that get in its way. Under the
14 infringement theory Acacia set forth in discovery, the limitation is satisfied by the
15 ability to enter “metadata,” which may include a “popularity code,” or for that matter,
16 any “code”:

17 The encoders used to encode video information, such as Windows Media
18 encoder, Real encoder, or other encoders, such as Cleaner, have
19 identification encoders which, in addition to allowing entry of a unique
20 identification code, allows entry of metadata associated with video
21 information. Metadata may include a popularity code, and therefore the
22 identification encoder allows entry of a popularity code.

23 (Miller Decl., Ex. PP at 462-463.) Acacia’s infringement-driven construction is
24 untenable.

25 The “popularity code” performs a specific function in the disclosed
26 transmission system. According to the patent specification, “[t]he popularity code
27 can be used to determine the most appropriate form of media storage of the
28 compressed data in a mixed media system.” (‘702 patent at 12:8-10.) “In some

1 cases, where multiple compressed data libraries 118 are organized, the popularity
2 code may dictate the distribution of a particular item to multiple distribution
3 systems.” (*Id.* at 12:41-43.) In its brief, Acacia acknowledges that the “popularity
4 code” of the ‘702 patent actually has a purpose in the transmission system. (Pl.’s Br.
5 at 27.)

6 Under Acacia’s construction, the “popularity code” does not have to enable any
7 function or be used in any way by the transmission system. This limitation would be
8 met, for example, if one could enter “metadata” that includes a movie rating, such as
9 four stars or two thumbs up, the phrase “#1 best seller,” or even descriptions like
10 “good” and “bad.” Such a result is absurd. A “code” does not become a “popularity
11 code” unless the “code” is used by the transmission system to determine the
12 appropriate location and media format for storage of compressed data.⁶

13 Accordingly, this limitation should be construed to require that the
14 transmission system (or, as the claim states the “identification encoder” element in
15 the transmission system) is set up to make use of the popularity code, and not simply
16 that one might be able to do so. Consistent with this requirement, as well as the
17 patent specification, the limitation should be construed to mean that “the
18 identification encoder is set up to permit entry of a code that is used by the
19 transmission system to determine the appropriate location and media format for
20 storage of compressed data associated with the code based upon the relative
21 popularity of the compressed data among users of the transmission system.

22
23
24
25 ⁶ Notably, Acacia argued that the “unique identification code” of the ‘992 patent
26 was a broad term that would “encompass” popularity codes. (Acacia Opp’n Br. at
27 29.) However, claim 6, which depends from claim 1, requires the identification
28 encoder to “give[] items ... a unique identification code” and also to “allow[]
entry of a popularity code.” Thus, the claims require that a “unique identification
code” and “popularity code” be distinct things, and is further proof that Acacia’s
construction of “unique identification code” is without merit.

1 **E. The Limitation “digital compressor” Should Be Construed As**
2 **Stated and Is Not Subject to Re-Interpretation By the Court.**

3 The parties agree that a certificate of correction is only effective for causes of
4 action arising after the certificate is issued. (*Compare* Defs.’ Br. at 26 with Pl.’s Br.
5 at 30.) Thus, if the Court lacks the authority to change the limitation “digital
6 compressor” recited in claim 1 of the ‘702 patent to “digital decompressor” as urged
7 by Acacia, then the limitation must be construed as issued for all actions arising
8 before April 15, 2003. (*See* Block Decl. Ex. 20.) Acacia’s own arguments that
9 “nowhere in the ‘702 patent is an embodiment described in which a compressor is
10 located in the reception system” and that the inclusion of the word “compressor” as a
11 limitation in claim 1 of the ‘702 patent “would make no sense,” only serve to confirm
12 that if the Court rejects Acacia’s request to rewrite claim 1 of the ‘702 patent, the
13 claim is invalid. (Pl.’s Br. at 31.) “Where it would be apparent to one of skill in the
14 art, based on the specification, that the invention set forth in a claim is not what the
15 patentee regarded as his invention, we must hold that claim invalid under § 112,
16 paragraph 2.” *Allen Eng’g Corp. v. Bartell Indus, Inc.*, 299 F.3d 1336, 1339 (Fed.
17 Cir. 2002).

18 Whereas corrections issued by the Patent Office are effective only as of the
19 date of the issued certificate of correction, corrections made by a district court are
20 retroactive—given effect as though made on the date the patent issued. *Novo*
21 *Industries, L.P. v. Micro Molds Corp.*, 350 F.3d 1348, 1357 (Fed. Cir. 2003).
22 Because there are serious public notice implications where retroactive effect is given
23 to changed patent claims, the Federal Circuit, while not completely eliminating the
24 district court’s authority to correct errors in a patent, strictly circumscribed the types
25 of corrections the district court may make. As articulated in *Novo*, the district court
26 may correct only *minor* errors in a patent and may only do so if the following two
27 conditions are met: “(1) the correction is not subject to reasonable debate based on
28 consideration of the claim language and the specification and (2) the prosecution

1 history does not suggest a different interpretation of the claims.” *Novo*, 350 F.3d at
2 1357.

3 While Acacia quotes the *Novo* two-prong test set forth above, it fails entirely to
4 cite the *Allen Eng’g* case, and then wrongly contends that the *Novo* test can be
5 applied to “major errors.” (Pl.’s Br. at 30.) Acacia’s attempt to convey additional
6 authority to the district court is incorrect and is inconsistent with its concession that
7 35 U.S.C. § 255 does not convey unlimited authority to make corrections even to the
8 PTO, which Acacia argues may itself only correct “*minor* errors made by the
9 applicant.” (*Id.* at 30) (emphasis added). Certainly, *Novo* cannot be read to hold that
10 the district court has greater authority to issue corrections than the PTO. In fact,
11 *Novo* makes clear that the opposite is true. 350 F.3d at 1356 (“Although we conclude
12 that Congress intended to preserve the authority of the district courts to correct errors,
13 we do not think that Congress intended that the district courts have the authority to
14 correct any and all errors that the PTO would be authorized to correct under sections
15 254 and 255.”)

16 In seeking to expand the *Novo* holding in this way, however, Acacia implicitly
17 concedes, as it must, that the error in the ‘702 patent is a **major** error, albeit one
18 within the authority of the PTO to correct. Acacia’s subsequent suggestion in its
19 brief that the error in the ‘702 patent is a mere “typographical/clerical error,” is belied
20 by Acacia’s own conduct following the issuance of the ‘702 patent. If, indeed, the
21 error in the ‘702 patent was trivial there would have been no need for Acacia to seek
22 a certificate of correction—Acacia could have simply relied upon a court to make the
23 correction if the patent was ever the subject of litigation. That Acacia sought the
24 certificate long after it filed suit against dozens of defendants, when, if what Acacia
25 argues is true, the error was subject to a correction by the district court, makes clear
26 that even Acacia did not believe the error to be within the district court’s authority to
27 correct. Moreover, if the error in the ‘702 patent actually was an obvious
28 typographical error as Acacia now contends, then why did Acacia—a plaintiff that

1 purports to have conducted extensive diligence on its patents before asserting them—
2 wait until December 12, 2002, more than two years after the '702 patent issued to
3 seek a certificate of correction?

4 Quite clearly, the error in claim 1 of the '702 patent is not trivial,
5 inconsequential, or obviously recognized. If it were, the Patent Office would have
6 refused to grant Acacia's request for a certificate of correction. *Novo*, 350 F.3d at
7 1356 ("At the same time, the PTO properly refuses to correct truly minor errors in the
8 section 255 process ... Mistakes which are too trivial, inconsequential, or obviously
9 recognized will not warrant the issuance of a certificate of correction."). In fact, the
10 error in the '702 patent is far more significant than the error in the patent at issue in
11 *Novo*. There, the limitation in question was "stop means formed on a rotatable with
12 said support finger." *Id.* at 1352 (emphasis added). The district court corrected this
13 error by replacing the word "a" with the word "and" believing the error to have been
14 an "obvious typographical error." *Id.* at 1353. The Federal Circuit reversed, finding
15 that the district court went beyond its authority and held the claim invalid as
16 indefinite. *Id.* at 1358.

17 The Federal Circuit in *Allen Engineering* also refused to change the word
18 "perpendicular" in the claim limitation "its gear box only in a plane perpendicular to
19 said biaxial plane" to the word "parallel," and held the claims that included this
20 limitation invalid as indefinite. *Id.* at 1359. The Federal Circuit rejected the
21 patentee's argument that even though one of skill in the art would understand that the
22 term "perpendicular" in the claims should be read to mean "parallel," the claims
23 nonetheless could not be corrected because "[i]t is not our function to rewrite claims
24 to preserve their validity." *Id.*; *Chef America, Inc. v. Lamb-Weston, Inc.*, 2004 WL
25 315222, *4 (Fed. Cir. 2004) (refusing to rewrite unambiguous claim language by
26 replacing the word "to" with the word "at" to conform to patentee's intent).

27 By the same token, it is not this Court's function to rewrite the claim limitation
28 "compressor" as "decompressor," to save claim 1 of the '702 patent from invalidity

1 for causes of action arising before April 15, 2003. In fact, Acacia's arguments that
2 the error is obvious only serves to undermine its claim that this Court should rewrite
3 it. The Court in *Allen Engineering* rejected this very argument—"it is of no moment
4 that the contradiction is obvious: semantic indefiniteness of claims 'is not rendered
5 unobjectionable merely because it *could* have been corrected.'" *Id.* (emphasis in
6 original). In fact, it is precisely because such errors *can* be corrected (by the PTO)
7 that the Federal Circuit is unsympathetic to patentee arguments that their claims
8 *should* be corrected (by the courts). "Moreover, it does not seem to us to be asking
9 too much to expect a patentee to check a patent when it is issued in order to
10 determine whether it contains any errors that require the issuance of a certificate of
11 correction." *Southwest Software, Inc. v. Harlequin Inc.*, 226 F.3d 1280, 1296 (Fed.
12 Cir. 2000); *Superior Fireplace Co. v. Majestic Products Co.*, 270 F.3d 1358, 1373
13 (Fed. Cir. 2001). Acacia was free to ask the Patent Office to correct the error in claim
14 1 at any time after the patent issued on November 7, 2000. That it failed to do so for
15 more than two years after the '702 patent issued, and then only after suing dozens of
16 companies, suggests either that the error is not as obvious as Acacia would have the
17 Court believe or that Acacia failed to diligently review the patents it now contends is
18 infringed by nearly every communication industry in the country.

19 **F. The Court Should Construe "transceiver" to Mean a Combination**
20 **of a Transmitter and a Receiver in a Common Housing that Users**
21 **Common Circuit Components for Both Transmitting and Receiving.**

22 There is no apparent dispute between the parties that the ordinary meaning of
23 the claim term "transceiver" is at least "a device that is capable of both transmitting
24 and receiving data." It is axiomatic that such a device must contain both a transmitter
25 and a receiver, which comports with Defendants' proposed construction. Given that
26 the parties also appear to agree that a transceiver is a single device, there is also no
27 apparent dispute that the transmitter and receiver that comprise the transceiver must
28 share a common housing, even though Acacia's proposed construction omits this
obvious and inherent limitation. (See '702 patent at FIGS. 2b, 6) (illustrating the

1 transceiver as a single box). Where the parties' proposed constructions diverge is in
2 the requirement that the transmitter and the receiver use some common circuit
3 components.

4 Apparently ignoring its own exhortation that during claim construction the
5 litigants must "be fair with the facts," Acacia quotes in its opening brief the portions
6 of select dictionary definitions for the term "transceiver" that it favors, and omits,
7 without comment, those portions of the dictionary definitions it dislikes. For
8 example, Acacia conveniently omits from its quotation of the *Dictionary of*
9 *Information Technology*, the first definition of the term "transceiver"—"a radio
10 transmitter and receiver unit in one housing and employing some common circuits,
11 normally used for portable or mobile operations," a definition that is fully in accord
12 with Defendants' proposed construction. (See Pl.'s Br. at 26; Block Decl. Ex. 17.)
13 Acacia also ignores the first definition of "transceiver" provided by the *IEEE*
14 *Standard Dictionary of Electrical and Electronics Terms*, 6th Ed.⁷—"The combination
15 of radio transmitting and receiving equipment in a common housing, usually for
16 portable or mobile use, and employing common circuit components for both
17 transmitting and receiving"—which is also fully in accord with Defendants' proposed
18 construction, in favor of a portion of the third definition provided by that reference.
19 (Pl.'s Br. at 26; Block Decl. Ex. 19.) Acacia also omits from its citation to the
20 *Dictionary of Computing* the third sentence in the definition—"Many communication
21 devices, including *modems, codecs, and terminals, are transceivers." (Pl.'s Br. at
22 26; Block Decl. Ex. 18.) Modems, an acronym for modulator/demodulator, and
23 codecs, an acronym for coder/decoder, are devices that perform two functions using
24 shared circuitry. Notably, Acacia also failed to mention that in *Inline Connection* the
25

26 ⁷ Acacia's reliance on the 6th Edition of this dictionary, which is copyrighted 1996,
27 is misplaced given that it was published more than 5 years after the priority filing
28 date of the '702 Patent. *Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc.*, 334 F.3d
1294, 1299 (Fed. Cir. 2003). Notably, Acacia was content to use the 5th Edition of
this dictionary in its previous claim construction briefs. Regardless, the primary
definition provided by the later edition is identical to the definition provided by
the 5th Edition.

1 court cited the entire definition of the term “transceiver” found in the *Dictionary of*
2 *Computing* when it construed “transceiver” as having its ordinary meaning. *Inline*
3 *Connection Corp. v. AOL Time Warner, Inc.*, 302 F.Supp. 2d 307, 325 n.79 (D. Del.
4 2004). Unlike the defendant in *Inline Connection*, Defendants urge the Court to
5 adopt the ordinary meaning of the “transceiver” and by the same token reject
6 Acacia’s call to adopt a partial definition of the term.

7
8 **G. The Court Should Construe “temporary storage device” to Mean a
Device that Stores Electronic Data that can be Overwritten.**

9 In the context of data transmission, one of skill in the art would understand that
10 a temporary storage device is a device in which data may be stored on an
11 impermanent basis. Unlike a permanent form of data storage such as a CD-ROM
12 disk, a temporary storage device may take the form of a hardware buffer, cache, or
13 hard disk drive. As such, the distinction between temporary storage and permanent
14 storage is the ability of the former to permit data to be overwritten.

15 Acacia proposed construction—“a device into which data may be placed,
16 retained for a limited time, and retrieved,” (Pl.’s Br. at 28-29.) while not appearing
17 significantly different than that proposed by Defendants, is so amorphous as to be
18 unhelpful. For example, what is “a limited time”? Does the phrase “a limited time”
19 provide the jury with any more guidance than the word “temporary”? In comparison
20 to the age of the earth, a limited time could be a million years. In this admittedly
21 extreme example, there would be no practical difference between temporary and
22 permanent storage, and the limitation would be rendered a nullity. Defendants’
23 practical construction of this limitation provides the jury with a useful distinction
24 between the two forms of storage device.

25
26 **H. “Ordering Means”: The Court Should Find the Corresponding
Structure to Be the Time Encoder With Its Associated Algorithms.**

27 In construing the “ordering means” limitation of the ‘992 patent, Acacia
28 wrongly contends that the function of “placing items into a sequence of addressable

1 data blocks” is limited to placing time markers on data. (Pl.’s Br. at 34.) Indeed, the
2 applicants argued during the prosecution of the European counterpart to the ‘992
3 patent:

4 Whilst it is true that data may be time stamped, this is only stated to be a
5 preferred embodiment (page 12, line 34). The skilled reader would be
6 able to envisage other means of encoding the data such that “ordering
7 means” could rearrange or shuffle it into a sequence of addressable data
8 blocks. Indeed, it may not even be necessary to encode the data at all.
9 All that is necessary, and as is defined in the claim, is that the ordering
10 means places the formatted data into a sequence of addressable data
11 blocks.

12 (Miller Decl., Ex. OO at 136.)

13 Consistent with the applicants’ statement to the EPO during the prosecution of
14 the identical limitation, and as set forth in Defendants’ briefs for the ‘992 patent, the
15 Court should construe the function to mean placing the formatted data into a
16 continuous series of memory units that contain digital information that can be given
17 an identifier.

18 As for the corresponding structure of the “ordering means,” the parties agree
19 that the “time encoder” is the only “structure” that corresponds to the recited
20 function. Although “time encoder” is another coined term that does not have a well
21 understood meaning connotative of structure, the patent remedies the deficiency by
22 providing an algorithm that the “time encoder” must perform consistent with *WMS*
23 *Gaming*.

24 The algorithm set forth in the patent includes receiving a series of digital data
25 bytes that represent mixed video and audio data. (‘702 patent at 8:7-19.) Once
26 received, the “time encoder” converts the series into a “sequence” where all the video
27 data is grouped together starting from the first frame to the last frame, and all of the
28 audio data is grouped together starting with the first and ending with the last sample

1 of audio data. (*Id.*) Once the data is “sequenced” into this continuous series of data
2 bytes, the function has been performed, and the “time encoder” places time markers
3 on the video frames and audio samples. (*Id.*)

4 In Acacia’s construction, the algorithm of the corresponding structure involves
5 only “assigning relative time markers to data prior to subsequent compression.”
6 (Pl.’s Br. at 35.) Acacia ignores the first steps of the algorithm in which the audio
7 and video data is actually placed into a sequence of addressable data blocks. (‘702
8 patent at 8:7-19.) Indeed, merely assigning time markers does not “place formatted
9 data into a sequence of addressable data blocks.”

10 Accordingly, the Court should find the structure that corresponds to the
11 function of the “ordering means” to be “a time encoder that receives a series of data
12 bytes that represents audio and video data, wherein the audio and video data is
13 commingled in the series, and placing the audio and video in a sequence where all of
14 the video data is in a group, starting with the first and ending with the last frame of
15 video, and all of the audio data is in a group, starting with the first and ending with
16 the last sample of audio data. In an additional embodiment, time markers are placed
17 on the video frames and audio samples.

18 **III. CONCLUSION**

19 For the foregoing reasons, Defendants request that the Court construe the
20 disputed claim limitations as requested herein.

21 Dated: May 13, 2004
