31 Case No. SACV 02-1040 JW (MLGx)

PLAINTIFF ACACIA'S CLAIM CONSTRUCTION BRIEF
RE: CLAIM TERMS IN THE '702 PATENT

1 “may be implemented in hardware or software.” (Dictionary of Computing, 3rd Ed.
2 1990, at 155; Exhibit 14 to Block Decl.) The term “encode” is also well-known and
3 means: “(1) to express a single character or a message in terms of a code; (2) to
4 produce a unique combination of a group of output signals in response to each of a
5 group of input signals; (3) to apply the rules of a code; and (4) to represent data in
6 symbolic form using a code or a coded character set such that reconversion to the
7 original form is possible.” (IEEE Dictionary, at 436-437; Exhibit 11 to Block Decl.)⁴

8 The term “encoder” is further defined and narrowed by the term “sequence,”
9 which means “a continuous or connected series.” (Webster’s, at 1073; Exhibit 12 to
10 Block Decl.) See also, Personalized Media Communications, LLC v. International
11 Trade Commission, 161 F.3d 696, 705 (Fed. Cir. 1998) (a qualification placed upon a
12 structure narrows the scope of the structures covered by the claim: “The use of the
13 word ‘digital’ in conjunction with the word ‘detector’ merely places an additional
14 functional constraint (extraction of digital information) on a structure (detector)
15 otherwise adequately defined.”). Thus, the type of encoder disclosed in the claim is
16 an encoder which creates a sequence. The definition of encode which is most
17 consistent with creating a sequence is “to produce a unique combination of a group of
18 output signals in response to each of a group of input signals.”⁵

19 The ordinary meaning of sequence encoder is therefore a device or software
20 capable of producing a unique combination of a group of output signals in response to
21 each of a group of input signals.

22
23
24 ⁴ The term “sequencer” is another way of expressing the phrase “sequence
25 encoder.” The term “sequencer” means “any of various devices for arranging (as
26 informational items or the events in the launching of a rocket) into or separating (as
amino acids) in a sequence.” (Webster’s, at 1073; Exhibit 12 to Block Decl.)

27 ⁵ As there are multiple definitions for “encode” (and therefore multiple
28 definitions for “encoder”), the Court must identify which of the possible dictionary
definitions is most consistent with the use by the inventors. Texas Digital, 308 F.3d at
1203.

1 The Court must next examine the specification to determine whether this
2 ordinary meaning for “sequence encoder” is consistent with the patent specification.
3 The phrase “sequence encoder” is not used in the specification of the ‘702 patent⁶.
4 Instead, the ‘702 patent discloses a time encoder which places formatted data into a
5 sequence of addressable data blocks:

6 The transmission system 100 of the present invention also
7 preferably includes ordering means for placing the formatted
8 information into a *sequence* of addressable data blocks. As
9 shown in FIG. 2a, the ordering means in the preferred
10 embodiment includes *time encoder* 114.

11 * * *

12 The *sequence* of addressable data blocks which was time
13 encoded and output by *time encoder* 114 is preferably sent to
14 precompression processor 115.
15 (‘702 patent, 7:50-54; 8:46-49; emphasis added).⁷

16 The time encoder is an encoder which places blocks of converted formatted
17 information into a sequence or group of addressable data blocks by assigning relative
18 time markers to data prior to subsequent compression. (‘702 patent, 7:57-59; 8:6-9;
19 8:46-49; Fig. 2a).

20 From the specification’s explicit descriptions of the invention, the invention
21 clearly involved sequencing data blocks through time encoding and using a time

22
23 ⁶ The fact that “sequence encoder” is not used in the specification, but only
24 appears in the claims, is permissible. All Dental Prodx, LLC v. Advantage Dental
25 Products, Inc., 309 F.3d 774, 779 (Fed. Cir. 2002), citing, Eiselstein v. Frank, 52 F.3d
26 1035, 1038 (Fed. Cir. 1995) (“However, the failure of the specification to specifically
27 mention a limitation that later appears in the claims is not a fatal one when one skilled
28 in the art would recognize upon reading the specification that the new language
reflects what the specification shows has been invented.”)

⁷ The specification further states that the processing includes “placing the
formatted data into a sequence of addressable data blocks by ordering means 114
(step 413c).” (‘702 patent, 18:15-19). The time encoder is indicated with reference
numeral 114 elsewhere in the patent. Step 413c in Figure 7 is “sequence data.”

1 encoder prior to subsequent compression to accomplish that task. The only sequence
2 encoder disclosed in the specification is the time encoder – no other sequence
3 encoder or sequencing scheme is explicitly disclosed or suggested in the specification.
4 The time encoder’s function disclosed in the specification is that time encoding of
5 data prior to subsequent compression. (‘702 patent, 8:46-48; 18:15-25; Figures 2a
6 and 7). The inventors described numerous benefits and uses of time encoding prior to
7 subsequent compression to the overall operation of the transmission and reception
8 system. For instance, according to the specification, time encoding allows users to
9 move through data in various modes by moving through frame addresses at various
10 rates (‘702 patent, 8:22-24). Time encoding makes items and subsets of items
11 retrievable and addressable throughout the transmission system (‘702 patent, 8:37-
12 39). Time encoding makes possible realignment of audio and video data after
13 separate audio and video compression (‘992 patent, 7:60-64 and 8:9-10). Lastly, time
14 encoding enables subsequent compression of the information to be improved, because
15 data reduction processes may be performed in the time dimension. (‘702 patent, 8:39-
16 43). From the specification, it is evident that the invention is limited to time encoding
17 by a time encoder prior to subsequent compression.

18 The facts of this case are strikingly similar to those of Phillips v. AWH Corp.,
19 2004 U.S. App. LEXIS 6758 (Fed. Cir. April 8, 2004) (Exhibit 14 to Block Decl.). In
20 Phillips, the invention at issue was for vandalism-resistant building modules
21 consisting of modular wall panels. The invention is useful in the field of prison
22 construction because the panels exhibit desirable sound and fire resistance, impact
23 resistance (i.e., against bullets, bombs), and axial and lateral load bearing qualities.
24 Phillips, at *2. The claim term at issue was “baffle” in the phrase “means . . .
25 comprising internal steel baffles extending inwardly from the steel shell walls.”
26 Phillips, at *2. The Federal Circuit held that this phrase was not construed as a
27 means-plus-function claim, because the term “baffles” is sufficient structure. Phillips,
28 at *10.

1 The court then construed “baffles” using ordinary claim construction rules.
2 The ordinary meaning of “baffles” is “something for deflecting, checking, or
3 otherwise regulating flow.” Phillips, *10. The court then looked to the specification
4 “to ascertain the meaning of a claim term as it is used by the inventor in the context
5 of the entirety of his invention.” Phillips, at *12, quoting, Comark Communications
6 v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). The court found the
7 specification “rife with references to impact resistance, especially against projectiles,
8 such as bullets and bombs.” Phillips, at *13. The specification further explained that
9 steel panels “form the internal baffles at angles for deflecting bullets.” Id.

10 The court therefore found that the inventors only described their invention in
11 the specification as having baffles oriented at angles other than 90 degrees and
12 therefore limited the construction of “baffles” to those which are oriented at angles
13 other than 90 degrees:

14 From the specification’s explicit descriptions of the invention,
15 we conclude that the patentee regarded his invention as panels
16 providing impact or projectile resistance and that the baffles
17 must be oriented at angles other than 90 degrees. Baffles
18 directed at 90 degrees cannot deflect projectiles as described in
19 the ‘798 patent, and, in any event, are disclosed in the prior art.

20 Phillips, at *15.

21 The court was not persuaded by the dissent-in-part, which argued that the
22 majority improperly focused on the “preferred embodiment,” because, in this case, the
23 preferred embodiment is the invention:

24 The dissent-in-part argues that we have interpreted the claims
25 erroneously by focusing only on the ‘preferred embodiment.’
26 We disagree. Inspection of the patent shows that baffles angled
27 at other than 90 degrees is the only embodiment disclosed in the
28

1 patent; it is the invention. It is impossible to derive anything
2 else from the specification.

3 Phillips, at *15.

4 Thus, even though the term “baffles” has an ordinary meaning that includes
5 baffles disposed both at 90 degrees and at angles other than 90 degrees, the court
6 nevertheless limited the construction of this term to angles other than 90 degrees,
7 because the specification made clear that this was the invention:

8 It is true that claims with the non-restrictive term ‘baffles’ were
9 allowed. However, the patent specification is intended to
10 support and inform the claims, and here it makes it
11 unmistakably clear that the invention involves baffles angled at
12 other than 90 degrees. It is in the interests of a sound patent
13 system and inventors, as well as the public, to hold inventors to
14 their disclosures.⁸

15 Phillips, at *17.

16 In this case, the ordinary meaning of “sequence encoder” includes a time
17 encoder, but could also include other sequence encoders. But, just as the only baffles
18 disclosed in the specification in the Phillips were disposed at an angle other than 90
19 degrees, in this case the only sequence encoder disclosed in the ’702 patent
20 specification is a time encoder. The description in the ’702 patent shows that the
21 inventors intended that the invention be limited to a time encoder using time encoding
22 prior to subsequent compression, because this is the only disclosure in the patent and
23

24 ⁸ Acacia’s original construction of “sequence encoder,” set forth in its original
25 discovery responses, was not limited to a time encoder. When Acacia made its
26 original discovery responses, the Phillips case had not been decided by the Federal
27 Circuit and it was not clear that a non-restrictive phrase, such as “sequence encoder,”
28 would take on a restrictive construction under the facts presented in this case. After
reading the Phillips case, which was decided on April 8, 2004, Acacia determined that
it could not support a broader construction and, therefore, on May 4, 2004, Acacia
supplemented its proposed construction to limit the construction of “sequence
encoder” to the time encoder. (See, Exhibit 15 to Block Decl.).

1 the inventors described the many benefits and uses of time encoding prior to
2 subsequent compression:

3 1. "Time encoding allows realignment of the audio and video
4 information in the compressed data formatting system 117 after separate video
5 and audio compression processing by precompression processor 115 and
6 compressor 116." ('702 patent, 8:60-64).

7 2. "Realignment of audio and video data, system addressing of
8 particular data bytes, and user addressing of particular portions of items are all
9 made possible through time encoding." ('702 patent, 8:9-12).

10 3. "Time encoding by time encoder 114 makes items and subsets of
11 items retrievable and addressable throughout the transmission system 100."
12 ('702 patent, 8:37-40).

13 4. "Time encoding enables subsequent compression of the
14 information to be improved because data reduction processes may be
15 performed in the time dimension." ('702 patent, 8:39-42).

16 These statements in the specification evidence the inventors' intent to restrict
17 the invention to time encoding by a time encoder prior to subsequent compression.⁹
18 As stated in Phillips, "[i]t is impossible to derive anything else from the
19 specification."¹⁰ Phillips, at *15.

20
21 ⁹ Because these statements in the specification evidence the inventors' intent to
22 limit the scope of the invention to time encoding by a time encoder, this case differs
23 from other recent cases in which there was no such evidence in the specification. See,
24 e.g., Liebel-Flarsheim Co. v. Mallinckrodt, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004);
25 Teleflex, Inc. v. Ficoso N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002).

26 ¹⁰ The fact that the '702 patent specification describes the "time encoder" as
27 "preferred" does not mean that the claim term "sequence encoder" must be interpreted
28 as being broader than "time encoder." "The usage 'preferred' does not of itself
29 broaden the claims beyond their support in the specification. Wang Laboratories, Inc.
30 v. America Online, Inc., 197 F.3d 1377, 1383 (Fed. Cir. 1999), citing, Great
31 American Transportation Corporation Corp. v. Cryo-Trans, Inc., 93 F.3d 766, 770
32 (Fed. Cir. 1996) (the teaching in the specification was "not just the preferred
33 embodiment of the invention; it is the only one described."); See also, Toro Co. v.
34 White Consolidated Industries, Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999) ("The
35 specification shows only a structure whereby the restriction ring is 'part of' the cover,
36 in permanent attachment. This is not simply the preferred embodiment; it is the only
