35 U.S.C. § 112 1, 6

35 U.S.C. § 282 8

Other Authorities

Webster's Ninth New Collegiate Dictionary, (1983) at 364..... 7

1 At the hearing on April 9, 2004, counsel for Plaintiff stated that, for the Court's
2 convenience, Plaintiff would provide the Court with a supplemental brief more
3 specifically setting forth the structure disclosed in the specification of the '992 patent
4 for the "identification encoding means" phrase from claim 1 of the '992 patent. This
5 brief memorandum both provides that information and responds to defendants
6 "Citation of Supplemental Authority" recently filed with this Court relating to the
7 same issue.

8 **A. There is Clear Support in the Specification for the Identification**
9 **Encoding Means**

10 Claim 1 of the '992 patent includes an "identification encoding means." The
11 two claimed functions of the identification encoding means are (1) to "retrieve the
12 information in the items [containing information] from the library means" and (2) to
13 "assign a unique identification code to the retrieved information." Acacia contends
14 that the structure disclosed in the patent specification for performing these functions
15 is a person (e.g., a system operator), identification encoder, and computer hardware
16 and/or software having source material library utilization capabilities. Defendants
17 contend, among other things, that the specification of the '992 patent does not
18 describe structure sufficiently "linked" to the performance of the function "to retrieve
19 the information in the items [containing information] from the library means" to
20 satisfy the requirements of 35 U.S.C. § 112 ¶ 2.¹ As described below, the
21 specification clearly does provide support showing that a system operator, together
22 with computer hardware and/or software having source material library utilization
23 capabilities, performs the function of retrieving information from the library means.

24 The phrase "library means" in claim 1 of the '992 patent refers to the "source
25 material library." The specification explains that the contents of the source material

26
27 ¹ The additional function of the "identification encoding means" to "assign a
28 unique identification code to the retrieved information" is performed by the
identification encoder which is described in the patent specification ('992 patent, 6:35-
38).

1 The specification explains to the reader that the information in items in the
2 source material library are retrieved as a user of the system requests such information:

3 As illustrated in Fig. 7, the first step of the distribution
4 method 400 involves retrieving the information for selected
5 items in the source material library 111, upon a request by a
6 user of the distribution system (step 412). This is analogous
7 to taking books off a shelf at the local public library after the
8 person has decided that he or she would like to read them.”
9 (‘992 patent, 18:53-59.)

10 The specification also makes clear that, in a preferred embodiment, retrieval of
11 items and information in the source material library occurs first, and thereafter the
12 retrieved information is converted into a predetermined format as formatted data.

13 The transmission system 100 of the present invention also
14 preferably includes conversion means 113 for placing the
15 items from source material library 111 into a predetermined
16 format as formatted data. In the preferred embodiment, after
17 identification encoding is performed by identification
18 encoder 112, the retrieved information is placed into a
19 predetermined format as formatted data by the converter
20 113.

21 (‘992 patent, 6:55-62.)

22 These descriptions of the function and contents of the source material library
23 unmistakably communicate to anyone (including, most importantly, those of ordinary
24 skill in the art) that human interaction and/or use of a computer is used to retrieve
25 items and information from the source material library. Where physical objects are
26 stored in the source material library and the information to be retrieved from those
27 physical objects needs to be converted to a machine readable form (digital or analog),
28 a human being would remove those objects from shelves, just as the user of the

1 claimed system analogously “take(s) books off a shelf at the public library.” Further,
2 computer hardware and software would obviously be used to digitize information
3 gleaned from physical objects such as “movies, audio recordings, still pictures, books,
4 ... documents of various sorts, ... and other physical objects,” since persons of
5 ordinary skill in the art know that such structure and components are the only way to
6 digitize data.

7 The use of computer hardware and software to perform the information retrieval
8 function from the source material library is additionally disclosed in the specification.
9 In pertinent part, the specification discloses:

10 The system may also preferably include dispatching control
11 software which receives input from the remote order
12 processing and item database 300 and sends distribution
13 requests to the distribution systems.... The dispatch
14 software may also preferably coordinate network traffic,
15 source material library utilization, source material library
16 contents, and connection costs.

17 (‘992 patent, 17:54-64.)

18 Software which coordinates source material library utilization is necessarily
19 computer software which coordinates the retrieval of information and items from the
20 source material library. The source material library is a depository of items containing
21 information. Its sole function is to store such items until needed. Thus, computer
22 software that coordinates source material utilization is software that coordinates
23 retrieval of information in the items from the library means. In the context of the
24 claimed systems and methods of the ‘992 patents, the only way to utilize a source
25 material library which holds or stores items of information is to retrieve items from the
26 source material library as needed. It has no other disclosed purpose, and that disclosed
27 purpose is repeatedly disclosed in the ‘992 patent. (Fig. 7, ‘992 patent 5:66-6:7, 6:10-
28 22; 6:55-62; 18:53-59.)

1 **B. The Dispatching Control Software is Clearly Linked to the**
2 **Retrieving Function**

3 In their “Citation of Supplemental Authority,” defendants argue that the
4 inventors did not link the function of retrieving to the dispatching control software.
5 According to defendants, the statement in the ‘992 patent that the dispatching software
6 “may also preferably coordinate network traffic, source material library 111
7 utilization, source material library 111 contents, and connection costs” (‘992 patent,
8 17:61-64) is insufficient to clearly link software to the “retrieving” function.
9 Defendants argue that, to have linked the function of retrieving to the dispatching
10 control software, the inventors would have had to specifically used the word
11 “retrieving” when identifying the functions of the dispatching control software.
12 (Defendants’ Citation at 5:15-18).

13 Federal Circuit law makes clear that specific words used in a claim need not
14 appear in the specification in order to link structure in the patent specification with the
15 function described in the claim. Rather, the test is what one of skill in the art would
16 understand from the specification:

17 The correct inquiry is to look at the disclosure of the patent
18 and determine if one of skill in the art would have
19 understood that disclosure to encompass software [the
20 alleged structure] for digital-to-digital conversion [the
21 claimed function] and been able to implement such a
22 program, not simply whether one of skill in the art would
23 have been able to write such a software program. . . . It is
24 important to determine whether one of skill in the art would
25 understand the specification itself to disclose the structure,
26 not simply whether that person would be capable of
27 implementing that structure.
28

1 Medical Instrumentation & Diagnostics Corp. v. Elekta AB, 344 F.3d 1205, 1212
2 (Fed. Cir. 2003); See also, In re Dossel, 115 F.3d 942, 946-47 (Fed. Cir. 1997)
3 (“Neither the written description nor the claims uses the magic word ‘computer,’ nor
4 do they quote computer code that may be used in the invention. Nevertheless, when
5 the written description is combined with claims 8 and 9, the disclosure satisfies the
6 requirements of § 112, ¶ 2.”)

7 The Federal Circuit in Medical Instrumentation found that there was insufficient
8 structure in the specification to perform the stated function of the claim because,
9 unlike this case, there was no structure disclosed to perform the particular function. In
10 Medical Instrumentation, the court found that the software disclosed in the
11 specification could not be a corresponding structure for the function of image format
12 conversion. The court found that the patentee’s expert “never pointed to any
13 disclosure of structure for digital-to-digital conversion in the specification.” (Id.)
14 Further, although the specification disclosed software and stated that the software
15 performed image editing, the reference in the specification to this software failed to
16 list image conversion [the claimed function] as one of the listed functions of the
17 software (Id. at 1215).

18 The facts of the present case are easily distinguishable from those of Medical
19 Instrumentation. The specification of the ‘992 patent discloses structure—the
20 dispatching control software. (‘992 patent, 17:54-66). One of the functions for the
21 dispatching control software stated in the specification is source material library
22 utilization. (‘992 patent, 17:61-64).

23 Here, unlike Medical Instrumentation, source material library utilization
24 describes the function of retrieving from the source material library. The only
25 function of the source material library is to make the stored items accessible to the
26 system. Thus, “utilization” of the source material library necessarily occurs when
27 items are accessed from the library. Items are accessed from the library by retrieving
28 them:

1 As illustrated in FIG. 7, the first step of the distribution
2 method 400 involves retrieving the information for selected
3 items in the source material library 111, upon a request by a
4 user of the distribution system (step 412). This is analogous
5 to taking books off of a shelf at the local public library after
6 the person has decided that he or she would like to read
7 them.

8 ('992 patent, 18:53-59).

9 Further, the use of the term “dispatching” in the name of the software
10 “dispatching control software” reinforces that one of its functions is to retrieve items
11 from the source material library. The term “dispatch” means “to send off or away with
12 promptness or speed.” Webster’s Ninth New Collegiate Dictionary, (1983) at 364.
13 What is being dispatched is the contents of the source material library—the items
14 containing information.

15 Thus, the specification communicates to those skilled in the art that the
16 dispatching control software performs the function of “retrieving” and the structure of
17 the “dispatching control software” is clearly linked to the function of retrieving items
18 from the library. See, Bancorp Services, L.L.C. v. Hartford Life Insurance Co., 359
19 F.3d 1367 (Fed. Cir. March 1, 2004), quoting, Honeywell Int’l, Inc. v. ITC, 341 F.3d
20 1332, 1338-39 (Fed. Cir. 2003) and Exxon Research & Eng’g Co. v. United States,
21 265 F.3d 1371, 1375 (Fed. Cir. 2001) (“We have held that a claim is not indefinite
22 merely because it poses a difficult issue of claim construction; if the claim is subject to
23 construction, i.e., it is not insolubly ambiguous, it is not invalid for indefiniteness....
24 ‘we protect the inventive contribution of patentees, even when the drafting of their
25 patents has been less than ideal.’ ... Thus, ‘close questions of indefiniteness in
26 litigation involving issued patents are properly resolved in favor of the patentee.’”) ²

27
28 ² The view—expressed in Freeman v. Gerber Products, Inc., 284 F. Supp. 2d 1290,
1296 (D. Kan. 2003) and discussed by defendants at 2:23 - 3:10—that “the statutory

1 **1. The Inventors Were Not Required to Disclose the Software**
2 **Algorithm Run by the Dispatching Control Software**

3 Defendants further contend in footnote 4, page 5, of their Citations of
4 Supplemental Authority, that claim 1 is invalid because the '992 patent specification
5 fails to disclose the software algorithm used by the dispatching control software.

6 This is incorrect. The court in Medical Instrumentation specifically stated that,
7 had it found that the software disclosed in the specification was clearly linked to the
8 claimed function, the fact that the patent failed to disclose the software code would not
9 render the claim invalid:

10 There was no need for a disclosure of specific circuitry in
11 that case [Intel Corp. v. VIA Technologies, Inc., 319 F.3d
12 1357, 1366 (Fed. Cir. 2003)], just as here there would be no
13 need for disclosure of the specific program code if software
14 were linked to the converting function and one skilled in the
15 art would know the kind of program to use.

16 Medical Instrumentation, 344 F.3d at 1214; See also, Civix-DDI, LLC v. Microsoft
17 Corp., 84 F. Supp. 1132, 1160 (D. Colo. 2000) (“To the extent CIVIX contends that
18 the corresponding structure to the recited functional clauses includes a logic processor
19 and software, Defendants argue that the clause is invalid as no specific algorithm for
20

21
22
23
24 presumption of validity has lost some of its impetus” in Section 112, ¶ 6 cases
25 involving patents issued prior to 1994 has not been adopted by the Federal Circuit. In
26 a case involving Section 112, ¶ 6 arguments with respect to a patent issued in 1979,
27 the Federal Circuit affirmed that the statutory presumption of validity (35 U.S.C.
28 § 282) applies. See, Intellectual Property Development, Inc. v. UA-Columbia
Cablevision of Westchester, Inc., 336 F.3d 1308, 1319 (Fed. Cir. 2003). The claims of
the '992 patent are presumed valid and defendants can only overcome this
presumption with clear and convincing evidence, which they have not done.
Intellectual Property, 336 F.3d at 1319.

1 performing the recited function has been disclosed. I disagree that the patentee must
2 disclose such an algorithm. Instead, I conclude that the disclosure of software,
3 different types of computers and databases, and related communications means is
4 sufficient.”)

5 Defendants’ reliance on WMS Gaming, Inc. v. International Game Tech., 184
6 F.3d 1339, 1348-49 (Fed. Cir. 1999) is misplaced. WMS does not hold that disclosure
7 of the software algorithm is required to satisfy the corresponding structure
8 requirement. WMS holds that “in a means-plus function claim in which the disclosed
9 structure is a computer, or microprocessor, programmed to carry out an algorithm, the
10 disclosed structure is not the general purpose computer, but rather the special purpose
11 computer programmed to perform the disclosed algorithm.” WMS Gaming, 184 F.3d
12 at 1349.

13 Here, the structure disclosed is software; it is not a microprocessor or general
14 computer and therefore WMS Gaming does not apply to this case.

15 **C. The Advanced Respiratory Case Supports Plaintiff’s Position that**
16 **Humans Can Be Structure for Means Claims**

17 In Advanced Respiratory, Inc. v. Electromed, Inc., 2003 U.S. Dist. LEXIS 823,
18 *14-15 (D. Minn. 2003), the court construed the claim phrase “means for venting. . .”
19 as being a structure which includes a human: “The Court therefore *construes the*
20 *structure* that corresponds to the venting function *to require human interaction* with a
21 tube, hose, or switch, or an equivalent structure, in order to vent pressurized air from
22 the bladder.” Id. (emphasis added).

23 Thus, the court construed this means-plus-function claim term as requiring the
24 human, and therefore the human was a requirement for infringement. The accused
25 device operated without human intervention; the court found that there was no
26 infringement:

1 Based upon the Court’s construction of the venting means of
2 the ‘263 Patent to require human interaction for venting, the
3 Court finds that the MedPulse product does not read on the
4 ‘263 Patent as a matter of law. The MedPulse product
5 clearly uses tiny perforations in the air bladder to provide
6 venting of pressurized air. This venting function is done
7 passively, without any active human intervention.

8 Advanced Respiratory, Inc. v. Electromed, Inc., 2003 U.S. Dist. LEXIS 8121, *13-14
9 (D. Minn. 2003).

10 **D. Structure May Be Disclosed Implicitly to Persons of Skill in the Art**

11 Defendants argue that Plaintiff cited Atmel Corp. v. Information Storage
12 Devices, Inc., 296 F.3d 1106, 1113 (Fed. Cir. 2002) at the April 9 hearing in an effort
13 to avoid the “clear link” requirement. Plaintiff did not cite Atmel for this proposition.
14 Plaintiff cited Atmel for the proposition that, to determine whether the specification
15 discloses sufficient structure, “the question for the court is whether one of skill in the
16 art would understand the specification to disclose corresponding structure.” Atmel,
17 198 F.3d at 1378. This is also the test for determining whether structure in the
18 specification is linked to the claimed function. Medical Instrumentation, 344 F.3d at
19 1212.

20 Plaintiff cited Creo Products, Inc. v. Presstek, Inc., 305 F.3d 1337, 1347 (Fed.
21 Cir. 2002) at the hearing for the proposition that, in determining whether the patent
22 properly discloses structure in the specification, sufficient structure may be disclosed
23 implicitly to persons of skill in the art:

24 To the extent that Creo contends that additional structure is
25 required for completely performing the function of “rotating
26 the cylinder,” we consider such structure to be implicit in the
27 disclosure of the ‘368 patent. Under our case law
28 interpreting Section 112, para. 6, knowledge of one skilled in
