The <i>y</i> sequence is constructed using the polynomial $1+X^5+X^7+X^{10}+X^{18}$.”); see also 3GPP TS 25.213 v6.0.0 at 22.</p>
<p>at least one adder for generating a $((K-1)*M+K)^{th}$ Gold code as a K^{th} primary scrambling code by adding a $((K-1)*M+K)-1$-times shifted first m-</p>	<p>Apple’s 3G Products contain at least one adder for generating a $((K-1)*M+K)^{th}$ Gold code as a K^{th} primary scrambling code by adding a $((K-1)*M+K)-1$-times shifted first m-sequence and the second m-sequence, wherein K is a natural number and M is a total number of secondary scrambling codes per one primary scrambling code.</p>

ASSERTED CLAIM (PATENT L.R. 3-1(A))	ACCUSED INSTRUMENTALITY AND HOW EACH ELEMENT IS MET BY ACCUSED INSTRUMENTALITY (PATENT L.R. 3-1(B)-(D))
<p>sequence and the second m-sequence, wherein K is a natural number and M is a total number of secondary scrambling codes per one primary scrambling code.</p>	<p>For example, Apple's 3G Products divide scrambling codes into 512 sets, each having one primary scrambling code and 15 secondary scrambling codes. As a result, $K = [1 \text{ through } 512]$ and $M = 15$. Apple's 3G Products add an "n" shifted first m-sequence with a second m-sequence to produce an n:th Gold code $z_n(i)$.</p> <p><u>Example No. 1:</u></p> <p>The primary scrambling codes consists of the scrambling codes $n=16*i$, where $i = 0, 1, 2 \dots 511$.</p> <p>For $K=1$, the first primary code is the 1st Gold code. This is calculated by substituting $K=1$ and $M=15$ into the equation $(K-1)*M+K$. As a result, the first primary code is the $(1-1)*15+1= 1\text{st Gold code}$. For $K=1$, $n=0$ because $i[1] = 0$ and $n=16*i$.</p> <p>The first Gold code is composed of a $((K-1)*M+K)-1$ shifted first m-sequence and second m-sequence. The value of the shift for $K=1$ is $((1-1)*15+1)-1 = 0$. For Gold code $z_n(i) = x((i+n) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$, where $i=0, \dots, 2^{18}-2$, $z_0(i)=x((i) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$.</p> <p><u>Example No. 2:</u></p> <p>For $K=2$, the second primary code is the 17th Gold code. This is calculated by substituting $K=2$ and $M=15$ into the equation $(K-1)*M+K$. As a result, the second primary code is the $(2-1)*15+2= 17\text{th Gold code}$. For $K=2$, $n=16$ because $i[2] = 1$ and $n=16*i$.</p> <p>The 17th Gold code is composed of a $((K-1)*M+K)-1$ shifted first m-sequence and second m-sequence. The value of the shift for $K=2$ is $((2-1)*15+2)-1 = 16$. For Gold code $z_n(i) =$</p>

<p>ASSERTED CLAIM (PATENT L.R. 3-1(A))</p>	<p>ACCUSED INSTRUMENTALITY AND HOW EACH ELEMENT IS MET BY ACCUSED INSTRUMENTALITY (PATENT L.R. 3-1(B)-(D))</p>
	<p>$x((i+n) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$, where $i=0, \dots, 2^{18}-2$, $z_{16}(i)=x((i+16) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$.</p> <p><u>Example No. 3:</u></p> <p>For $K=3$, the third primary code is the 33rd Gold code. This is calculated by substituting $K=3$ and $M=15$ into the equation $(K-1)*M+K$. As a result, the third primary code is the $(3-1)*15+3=33$rd Gold code. For $K=3$, $n=32$ because $i[3] = 2$ and $n=16*i$.</p> <p>The 33rd Gold code is composed of a $((K-1)*M+K)-1$ shifted first m-sequence and second m-sequence. The value of the shift for $K=3$ is $((3-1)*15+3)-1 = 32$. For Gold code $z_n(i) = x((i+n) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$, where $i=0, \dots, 2^{18}-2$, $z_{32}(i)=x((i+32) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$.</p> <p><i>See 3GPP TS 25.213 v5.0.0 at 22, § 5.2.2 “Scrambling code,” (describing the n:th Gold code sequence “z_n, $n=0,1,2,\dots,2^{18}-2$,” as defined as “$z_n(i) = x((i+n) \text{ modulo } (2^{18} - 1)) + y(i) \text{ modulo } 2$, $i=0, \dots, 2^{18}-2$” where “$n=16*i$ where $i=0\dots511$.”); <i>see also id.</i> at 22 (“A total of $2^{18}-1 = 262,143$ scrambling codes, numbered $0 \dots 262,142$ can be generated. However not all the scrambling codes are used. The scrambling codes are divided into 512 sets each of a primary scrambling code and 15 secondary scrambling codes.”); <i>see also 3GPP TS 25.213 v6.0.0.</i></i></p>
<p>26. The apparatus of claim 25, wherein the secondary scrambling codes of the K^{th} primary scrambling codes are the $((K-1)*M+K+1)^{th}$ through $(K*M+K)^{th}$ Gold codes.</p>	<p>Apple’s 3G Products contain secondary scrambling codes of the K^{th} primary scrambling codes that are the $((K-1)*M+K+1)^{th}$ through $(K*M+K)^{th}$ Gold codes.</p> <p>For example, Apple’s 3G Products divide scrambling codes into 512 sets, each having one primary scrambling code and 15 secondary scrambling codes. The primary scrambling codes consist of scrambling codes $n=16*i$ where $i=0\dots511$. The i:th set of secondary</p>

ASSERTED CLAIM (PATENT L.R. 3-1(A))	ACCUSED INSTRUMENTALITY AND HOW EACH ELEMENT IS MET BY ACCUSED INSTRUMENTALITY (PATENT L.R. 3-1(B)-(D))
	<p>scrambling codes consists of scrambling codes $16*i+k$, where $k=1\dots15$. As a result, for every 16 scrambling codes, the first code is a primary scrambling code whereas the 2nd through 16th codes are secondary codes.</p> <p><u>Example No. 1:</u></p> <p>For $K=1$, $((K-1)*M+K+1) = (1-1)*15+1+1) = (0+2) = 2$ and $(K*M+K) = (1*15+1) = (15+1) = 16$. In Apple's 3G Products, the first primary scrambling code is $n=16*0 = 0$, while the secondary scrambling codes consists of $16*0+k$ (where $k = 1\dots15$) = $[1\dots15]$.</p> <p>As a result, for the first group of 16 scrambling codes (0 through 15), the first scrambling code is a primary scrambling code (code 0), whereas codes 2 through 16 are secondary scrambling codes.</p> <p><u>Example No. 2:</u></p> <p>For $K=2$, $((K-1)*M+K+1) = ((2-1)*15+2+1) = (15+3) = 18$ and $(K*M+K) = (2*15+2) = (30+2) = 32$. In Apple's 3G Products, the second primary scrambling code is $n=16*1 = 16$, while the second group of secondary scrambling codes consists of $16*1+k$ (where $k = 1\dots15$) = $[17\dots31]$.</p> <p>As a result, for the second group of 16 scrambling codes (16 through 31), the first scrambling code (code 16) is a primary scrambling code whereas codes 2 through 16 (codes 17 through 31) are secondary scrambling codes.</p> <p><u>Example No. 3:</u></p> <p>For $K=3$, $((K-1)*M+K+1) = ((3-1)*15+3+1) = (30+4) = 34$ and $(K*M+K) = (3*15+3) =$</p>

ASSERTED CLAIM (PATENT L.R. 3-1(A))	ACCUSED INSTRUMENTALITY AND HOW EACH ELEMENT IS MET BY ACCUSED INSTRUMENTALITY (PATENT L.R. 3-1(B)-(D))
	<p>$(45+3) = 48$. In Apple's 3G Products, the third primary scrambling code is $n=16*2 = 32$, while the third group of secondary scrambling codes consists of $16*2+k$ (where $k = 1 \dots 15$) = $[33 \dots 47]$.</p> <p>As a result, for the third group of 16 scrambling codes, the first scrambling code (code 32) is a primary scrambling code whereas codes 2 through 16 (codes 33 through 47) are secondary scrambling codes.</p> <p><i>See</i> 3GPP TS 25.213 v5.0.0 at 21, §5.2.2 "Scrambling code" ("A total of $2^{18} - 1 = 262,143$ scrambling codes, numbered $0 \dots 262,142$ can be generated. However not all the scrambling codes are used. The scrambling codes are divided into 512 sets each of a primary scrambling code and 15 secondary scrambling codes.
