[57] ABSTRACT

A radiotelephone/pager unit (100) includes a housing enclosing (102, 104) radiotelephone circuitry (224) coupled to a radiotelephone antenna (108) operable at radiotelephone frequencies and pager circuitry (218) coupled to a pager antenna (212) operable at pager frequencies. The radiotelephone antenna (108) is located outside the housing (102, 104) in a conventional manner. The pager antenna (212) is located outside the housing (102, 104) and concealed under or integrally formed with a hand grip (122), a display lens (402), an escutcheon (502), a keypad (110), or a cap (601) such that the pager antenna's presence is unnoticeable to a user. The pager antenna (212) forms a loop antenna substantially surrounding a user interface element such as a display (112), a keypad (110), an earpiece (114) or volume control buttons (118, 120) to minimize space.

RECEIVER HAVING CONCEALED EXTERNAL ANTENNA

This is a continuation of application Ser. No. 08/023,234,
filed Feb. 25, 1993 and now abandoned.

FIELD OF THE INVENTION

The present invention relates generally to antennas and
more particularly to concealment of a pager antenna external
to a radiotelephone/pager unit.

BACKGROUND OF THE INVENTION

Paging systems And radiotelephone systems, such as
cellular radiotelephone systems, have gained widespread
acceptance over the years. The trend in growth of these
systems has continued to be positive, especially as the
technology has evolved to enable reductions in the size and
weight of pagers and portable cellular radiotelephones.
Many of the users of portable cellular radiotelephones have
continued to be users of pagers, which has resulted in the
requirement that those users carry not only a portable
cellular radiotelephone but also a pager. With the trend in
technology continuing to enable further miniaturization of
both portable cellular radiotelephones and pagers, it is now
possible to combine both elements into a single portable
unit. Such a combination, however, has been shown to create
problems not previously encountered when both the portable
cellular radiotelephone and the pager were separate units.

The portable radiotelephone typically has an antenna
outside an at least partially shielded housing for transmitting
and receiving radio frequency signals at radiotelephone
frequencies. The pager typically has an antenna inside an
unshielded housing for receiving radio frequency signals
pager frequencies. When a pager is combined with the
portable radiotelephone into a single unit, the location of the
radiotelephone antenna and the pager antenna is considered.

The most likely place for the radiotelephone's antenna is
at its conventional location outside the radiotelephone hous-
ing. Consideration is given to the location of the pager's
antenna both inside and outside the radiotelephone's hous-
ing. The pager antenna can not be located inside the radio-
telephone's shielded housing portion, since the shielded
housing would prevent the pager's antenna from receiving
paging signals. The pager's antenna can be located inside an
unshielded portion of the radiotelephone's housing,
however, the compactness of a single unit makes unshielded
locations rare. Furthermore, remotely locating the pager's
antenna from the pager circuitry to reach an unshielded
location produces inefficiencies in the pager's antenna. The
pager antenna can be located outside the radiotelephone's
housing. However, locating the pager antenna in addition to
the radiotelephone antenna outside the radiotelephone's
housing would change the external appearance of the radio-
telephone and possibly increase its size.

Thus, there is a need for a beneficial location for the pager
antenna without compromising the antenna's performance or
the appearance and size of the unit.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a perspective view of a radiotelephone/pager
unit constructed in accordance with the present invention.

FIG. 2 is an exploded view of the radiotelephone/pager
unit of FIG. 1 showing a first location of a pager antenna.

FIG. 3 is a perspective view of the pager antenna of FIG.
2 integrally formed with switch contacts.

2

FIG. 4 is an exploded view of the radiotelephone/pager
unit of FIG. 1 showing a second location of the pager
antenna.

FIG. 5 is an exploded view of the radiotelephone/pager
unit of FIG. 1 showing a third location of the pager antenna.

FIG. 6 is an exploded view of the radiotelephone/pager
unit of FIG. 1 showing a fourth location of the pager
antenna.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Referring now to FIG. 1, there is shown a perspective
view of a combination radiotelephone/pager unit **100** con-
structed in accordance with the present invention. The unit
100 generally includes: a front housing **102**, a back housing
104, a battery **106**, a radiotelephone antenna **108**, a keypad
110, a display **112**, an earpiece **114**, a microphone **116**,
volume control buttons **118** and **120**, a hand grip **122** and an
alert **124**.

The external appearance and functionality of the unit's
radiotelephone portion is similar to that of a conventional
portable cellular radiotelephone, model number 1293A,
manufactured and available from Motorola, Inc. The func-
tionality of the unit's pager portion is similar to that of a
conventional pager, named "Bravo", also manufactured and
available from Motorola, Inc. The user interface such as the
keypad **110**, volume control buttons **118** and **120**, display
112 and alert **124** are commonly used by both the radiotele-
phone portion and the pager portion of the unit **100**.

The unit **100** uses the radiotelephone antenna **108** to
conventionally transmit and receive radiotelephone signals
at radiotelephone frequencies. The unit **100** uses a pager
antenna (not shown in FIG. 1) to conventionally received
pager signals at pager frequencies.

A unique element of the present invention which will be
shown and discussed later in the preferred embodiments of
the present invention is that the pager antenna is located
outside the radiotelephone's housing and yet not noticeable
to a user. The following preferred embodiments of the
present invention will show the pager's antenna being
concealed by covers forming conventional radiotelephone
parts including but not limited to the hand grip **122**, the
keypad **110**, a lens of the display **112** and also by a cap
secured to the front housing **102**. Benefits of concealing the
pager antenna with these covers outside the radiotelephone's
housing include maintaining the radiotelephone's external
appearance, having the pager's antenna outside any shielded
portion of the radiotelephone's housing and keeping the
pager's antenna close to the pager's circuitry. The following
preferred embodiments of the present invention will also
show the pager's antenna forming a loop substantially
surrounding the tactile, visual and acoustic user interface of
the unit **100** including but not limited to the volume control
buttons **118** and **120**, the keypad **110**, the display **112**, and
the earpiece **102**. Surrounding user interface of the unit **100**
with a loop antenna beneficially minimizes the space con-
sumed by the antenna for the unit **100**.

Referring now to FIG. 2 there is shown an exploded view
of the radiotelephone/pager unit **100** of FIG. 1 showing a
first preferred location of a pager antenna. FIG. 2 generally
includes: the hand grip **122** having the volume control
buttons **118** and **120**, the front housing **102** including a
shielded portion **204**, a recess **206** and discrete volume
control contacts **208** and **210**, a pager antenna **212** including
capacitors **214** and **216**, pager receiver circuitry **218** on a
printed circuit board **220**, the keypad **110**, a keypad printed

3

circuit board 222, radiotelephone transceiver circuitry 224 on a printed circuit board 226, the radiotelephone's antenna 108, the rear housing portion 104 and the battery 106.

The radiotelephone's antenna 108 is coupled to the radiotelephone's transceiver circuitry 224 for transmitting and receiving radio frequency signals at radiotelephone frequencies. The pager antenna 212 is coupled to the pager receiver circuitry via terminals 201 and 202 for receiving radio frequency signals at pager frequencies. Arrow 228 represents electrical interconnection between the pager receiver circuitry 218 and the radiotelephone transceiver circuitry 224. Arrow 230 represents electrical interconnection between the keypad printed circuit board 222 and the radiotelephone transceiver circuitry 224. All of the elements of FIG. 2 with the exception of the pager's antenna 212 are conventionally assembled to produce the completed unit 100. Note that although three printed circuit boards 220, 222 and 226 are shown in FIG. 2, they are permitted to be combined into one circuit assembly if desirable.

The pager antenna 212 forms a conventional loop antenna having tuning capacitors 216 and 214 permitting adjustment of the loop antenna. The loop antenna is used for its space saving attributes in confined areas. Preferably, the loop antenna is formed as a conductive pattern disposed on an insulated substrate, such as a conventional circuit board.

The first preferred location of the pager antenna 212 is disposed outside the shielded portion 204 of the front housing 102, under the hand grip 122 and surrounding the volume control buttons 118 and 120 and their corresponding contacts 208 and 210. The pager antenna 212 is disposed in a recess 206 formed in the front housing portion 102 such that the presence of the pager's antenna under the hand grip 122 is unnoticeable to the user. When the pager antenna and the hand grip 122 are assembled with the front housing 102, the hand grip 122 maintains an essentially planar position with respect to the front housing 102.

Referring now to FIG. 3, there is shown a perspective view of the pager antenna of FIG. 2 integrally formed with the contacts 208 and 210 to produce integral contacts 308 and 310. The pager antenna 212 formed as a conductive pattern loop and the contacts 308 and 310 are formed as conductive patterns disposed on an insulated substrate such as a circuit board. Terminals 201 and 202 provide coupling for the loop antenna and terminals 303-306 provide coupling for the integral contacts 308 and 310. This design approach provides the advantages of lower parts count, cost and assembly time over the discrete contacts 208 and 210 of FIG. 2.

Referring now to FIG. 4, there is shown an exploded view of the radiotelephone/pager unit 100 of FIG. 1 showing a second preferred location of the pager antenna 212. The second preferred location of the pager antenna 212 is disposed outside the front housing 102, under a display lens 402 and surrounding the display 112. The pager antenna forms a loop antenna configured to be disposed on a recessed ledge 404. The pager antenna terminals 201 and 202 couple to the pager receiver circuitry 218 via a hole 406 in the front housing 102. The display lens 402 has an opaque boarder 408 for concealing the pager antenna 212 under the display lens 402. Note that with the location of the pager receiver circuitry at the earpiece end of the unit 100, the pager antenna at the display area remains close to the pager receiver circuitry.

Referring now to FIG. 5, there is shown an exploded view of the radiotelephone/pager unit of FIG. 1 showing a third preferred location of the pager antenna. The third preferred

4

location of the pager antenna 212 is disposed outside the front housing 102, under an escutcheon 501 and surrounding a portion of the keypad 110. The pager antenna forms a loop antenna configured to be disposed in a recess 504. The pager antenna terminals 201 and 202 couple to the pager receiver circuitry 218 via a hole 506 in the front housing 102. The escutcheon 502 has an opaque surface for concealing the pager's antenna 212 under the escutcheon 502. Note that this location of the pager antenna is close to pager receiver circuitry located under the keypad 110 of the unit 100. The escutcheon 502 for the keypad 110 is generally considered to be a separate cover attachable to the unit 100 including but not limited to a nameplate. An alternative practice for concealing the pager antenna that is equivalent to using the escutcheon is a membrane keypad wherein at least the top surface of the keypad exposed to the user covers not only the pager antenna 212 but also the portion of the front housing 102 between individual keypad buttons.

Referring now to FIG. 6, there is shown an exploded view of the radiotelephone/pager unit 100 of FIG. 1 showing a fourth preferred location of the pager antenna. The fourth preferred location of the pager's antenna 212 is disposed outside the front housing 102, under a cap 601 and surrounding the earpiece 104. The pager's antenna forms a loop antenna configured to be disposed in a recess 604. The pager's antenna terminals 201 and 202 couple to the pager receiver circuitry 218 via a hole 606 in the front housing 102. The cap 601 has an opaque surface, preferably matching the front housing, for concealing the pager's antenna 212 under the cap 601. The cap 601 is attachable to the front housing 102 and shaped to provide styling for the unit 100. Note that this location of the pager antenna is close to pager receiver circuitry located in the earpiece portion of the unit 100. Note that the earpiece 114 represents any electroacoustic transducer including but not limited to the microphone 116 and the alert 124.

The discussion for each of the four preferred locations for the pager's antenna describe the pager antenna being located within a recess of the front housing 102. An alternative design to the housing recess producing an equivalent result as the housing recess is to place the recess in the part itself (i.e. a recess in the hand grip 122, lens 402, escutcheon 502 and the cap 601) rather than in the front housing 102. Additionally, the pager antenna may also be integrally formed with the part rather than being a separate part. This is accomplished by molding or assembling the loop antenna into the the hand grip 122, lens 402, escutcheon 502, keypad 110 and the cap 601, for example.

Although the preferred embodiments disclose the pager antenna as a loop antenna for space saving benefits, other antenna structures such as a dipole antenna producing substantially equivalent results may be substituted.

What is claimed is:

1. A combination radiotelephone/pager unit including a user interface, comprising:
 - a housing enclosing radiotelephone and pager circuitry;
 - a radiotelephone antenna coupled to the radiotelephone circuitry; and
 - a pager antenna coupled to the pager circuitry;
 wherein the pager antenna forms a loop surrounding at least a portion of the user interface and is disposed between an outside surface of the housing and the at least a portion of the user interface.
2. A combination radiotelephone/pager unit according to claim 1 further comprising a shield for shielding at least one of the radiotelephone and pager circuitry.

5

3. A combination radiotelephone/pager unit according to claim 1 wherein the user interface further comprises at least one of the following: an acoustic, a visual and a tactile interface.

4. A combination radiotelephone/pager unit according to claim 3 wherein the acoustic, visual and tactile interface further comprises an electroacoustic transducer, a display and a switch, respectively.

5. A combination radiotelephone/pager unit according to claim 1 wherein the pager antenna is integrally formed with at least a portion of the user interface.

6. A combination radiotelephone/pager unit comprising: radiotelephone and pager circuitry;

a housing substantially enclosing the radiotelephone and pager circuitry;

an electromagnetic shield, disposed in the housing and at least partially covering at least one of the radiotelephone and pager circuitry, formed of an electrically conductive, electromagnetic wave-absorbing material for absorbing electromagnetic energy radiated by or towards the at least one of the radiotelephone and pager circuitry;

a radiotelephone antenna coupled to the radiotelephone circuitry;

a pager antenna coupled to the pager circuitry, carried on an outside, nonconductive surface of the housing and disposed outside the electromagnetic shield; and

a substantially planar and detachable cover, attached to the outside, nonconductive surface of the housing, for concealing the pager antenna between the cover and the outside, nonconductive surface of the housing such that the pager antenna is unnoticeable to a user of the unit.

7. A combination radiotelephone/pager unit according to claim 6 wherein the cover further comprises at least one of the following: a hand grip, a keypad, a lens, an escutcheon, a keypad and a cap.

8. A combination radiotelephone/pager unit according to claim 6 wherein the pager antenna is disposed between the outside surface of the housing and the cover.

9. A combination radiotelephone/pager unit according to claim 6 wherein the pager antenna is integrally formed with the cover.

10. A combination radiotelephone/pager unit according to claim 9 wherein the user interface further comprises at least one of the following: an acoustic, a visual and an active interface.

11. A combination radiotelephone/pager unit according to claim 10 further comprises a user interface substantially surrounded by the loop antenna.

12. A combination radiotelephone/pager unit according to claim 11 wherein the user interface further comprises at least one of the following: an acoustic, a visual and a tactile interface.

6

13. A receiver including a user interface comprising: a housing;

receiver circuitry disposed in the housing; and

an antenna coupled to the receiver circuitry;

wherein the antenna forms a loop surrounding at least a portion of the user interface and is disposed between an outside surface of the housing and the at least a portion of the user interface.

14. A receiver according to claim 13 wherein the user interface further comprises at least one of the following: an acoustic, a visual and a tactile interface.

15. A receiver according to claim 14 wherein the acoustic, visual and tactile interface further comprises an electroacoustic transducer, a display and a switch, respectively.

16. A receiver according to claim 13 wherein the antenna is integrally formed with at least a portion of the user interface.

17. A receiver comprising:

receiver circuitry;

a housing substantially enclosing the receiver circuitry;

an electromagnetic shield, disposed in the housing and at least partially covering the receiver circuitry, formed of an electrically conductive, electromagnetic wave-absorbing material for absorbing electromagnetic energy radiated by or towards the receiver circuitry;

an antenna coupled to the receiver circuitry, carried on an outside, nonconductive surface of the housing and disposed outside the electromagnetic shield; and

a substantially planar and detachable cover, attached to the outside, nonconductive surface of the housing, for concealing the antenna between the cover and the outside, nonconductive surface of the housing such that the antenna is unnoticeable to a user of the receiver.

18. A receiver according to claim 17 wherein the cover further comprises at least one of the following: a hand grip, a keypad, a lens, an escutcheon, a keypad and a cap.

19. A receiver according to claim 17 wherein the antenna is disposed between the outside surface of the housing and the cover.

20. A receiver according to claim 17 wherein the antenna is integrally formed with the cover.

21. A receiver according to claim 17 wherein the antenna further comprises a loop antenna.

22. A receiver according to claim 21 further comprises a user interface substantially surrounded by the loop antenna.

23. A receiver according to claim 22 wherein the user interface further comprises at least one of the following: an acoustic, a visual and a tactile interface.
