

Exhibit “A”

Summary Fact Sheet

"Samson" is believed to be the third most complete specimen by bone count, and one of only three with more than 50% of its original skeletal bones.

"Samson" has arguably the best preserved skull, as most other specimens, including "Sue," were discovered with the skulls crushed over geologic time.

"Samson" is equal in size and stature to "Sue," long considered the largest example discovered.

"Samson" has tentatively been identified as a possible holotype of a new species of the *Tyrannosaurus* genus.
