Family Systems Launches the iBook® Family of Software Products for a Better Way of Working Together

MySharer™ Provides Transparent Web Publishing for Non-Technical Users

March 12, 2002, New York

Family Systems has announced the launch of the iBook® family of products, which support individuals and distributed project groups as they work and collaborate together wherever they are. Family Systems is also offering iBook enhanced Web sites to bring fast, easy and inexpensive Web publishing to non-technical users.

The iBook software system leads the iBook family of products. Patented iBook technology provides interactive Web books for anyone with access to a Web browser, a text editor, and the Internet. With iBook interactive books, any non-technical user can publish their documents and other standard personal and office files to the Web for private or public access.

Also being launched today is Family Systems mysharer, a Web robot that automatically publishes files to Web sites, and Fax Processor, for automated Web publishing of faxed documents. Products under development include Audio Recorder, for recording and indexing telephone conference calls. All three products are part of the Family Systems solution for distributed work groups and communities.

Executives, managers, knowledge workers, authors, developers, and other busy professionals can save time and step in making their creative output available to others for collaboration and communication. Users can create and control interactive iBook sites without having to think about complex file transfer operations or directory and file management. Family Systems also offers iBook users Web site hosting and communications services through a relationship with [Radian Communications](#).

On a Mission

Family Systems mission is to support the communication and collaboration needs of individuals and their communities, whether project teams, affiliation groups, families, or enterprises. The company's personal and family systems integrate web, fax, email and telephone, and facilitate working from home, from an office, or while traveling.

"Our products help people manage the details, at work or at home, individually or in groups," according to Family Systems founder Brian Reynolds. "Executives and directors can provide our tools to their assistants, who can then better manage the flow of information

between them and the various organizations, people and commitments in their lives. This has been my own situation. I wanted to develop these products to improve my productivity with the people I collaborate with around the world.

"Technical professionals can better coordinate distributed project teams through the use of our audio recording systems. These provide transcribed and indexed versions of all our conference calls at Family Systems. Our virtual organization, which routinely ties together software developers, managers, administrators and sales/marketing people in several countries, would not be possible without the tools.

"The Family Systems Ibook system is great for giving us a platform on the Web to interactively publish, store and selectively display the memos, reports, research and links I want to make easily accessible to the members of my teams, wherever they or I happen to be."

About Family Systems

Family Systems is a distributed technology research and development organization that makes extensive use of its own work group collaboration technologies. A wide variety of innovative contributors each operate from their home locations internationally. The intellectual property they create and manage -- software code, documentation, Web pages, and recorded conference calls -- is stored on Ibook-enabled servers for web, fax and telephone content.
