## Learn About Our Nitrogen AutoSafe Program

At the Fred Martin Auto Group, one of our goals is to help keep your vehicle safe and running efficiently. We have found that using the new technology of replacing air in your tires with nitrogen is a very important step to keeping you safe on the road. Nitrogen is a very dense gas that is not affected by extreme temperature changes and holds a constant pressure in your tires. This helps drivers by avoiding blow-outs on the road because of low air pressure, and the constant pressure helps increase fuel mileage. This can drop 0.4% for every 1lb of pressure when your tires are

either under or over inflated. We usually find that

when most vehicles come in for service, they are three to five pounds low on air, so customers have been paying more at the pump. Using nitrogen to keep tire pressure constant also helps eliminate the chance of developing irregular wear patterns on your tires.

To make the switch from air to nitrogen, we remove all the oxygen from your tires and install the nitrogen at 95% purity level. This is completed with our nitrogen fill machines and you can watch as this procedure is performed in our service lanes. A lifetime fill of nitrogen is normally \$29.95, but this month we are offering it at a low price of

# \$19.95

If you have any questions, feel free to call our service department about the new Nitrogen AutoSafe Program.
