

EXHIBIT A
Simplified Chart Of Proposed Claim Term Definitions

Term	Google Proposal	Traffic Proposal
computer system	No construction necessary	a computer or computers that receive data representative of vehicular movement from the traffic monitors and send traffic information representative of said signals transmitted by said traffic monitors to the mobile user stations by way of the network.
data representative of traffic	Indefinite; alternatively, the current speed, frequency, or flow of multiple vehicles traveling along a road	No construction necessary; alternatively, traffic information.
displayed/displaying graphically	Represented other than in text format	information representative of the map database and the traffic information are displayed in a pictorial format, such as a drawing, on the display of the mobile user station. Other information may be displayed, as well.
providing. . .in response to/thereto	In response to a commuter's request, providing relevant traffic information for display by the mobile user station to minimize manipulation by the commuter while driving, the request and the response must occur simultaneously	"in response to" means that the computer system, rather than only arbitrarily sending traffic information representative of said signals transmitted by said traffic monitors, is capable of sending traffic information representative of said signals transmitted by said traffic monitors to a mobile user station as a result of the mobile user station sending a request for traffic information to the computer system; "providing to said one of said mobile user stations" does not need a construction. However, if one is required, "providing to said one of said mobile user stations" means that the computer system supplies data to the mobile user station
information representative of . . . selected portions of said traffic information database	Indefinite in identification of selecting entity (i.e. user or system) and kind of information selected; alternatively, the current speed, frequency, or flow of multiple vehicles traveling along a road as detected by the traffic monitors, a subset of which is selected by the commuter	"information representative of selected portions of said map database and selected portions of said traffic information database" means that certain data from the map database and certain data from the traffic information database are transmitted to the mobile user station.
interconnected	No construction necessary	the computer system facilitates the continuous or periodic movement of data from the receiver to the network.

less than all available traffic information	Indefinite in degree (i.e. amount of information) and kind of information	the computer system may send traffic information corresponding to only some of the traffic monitors
map database	No construction necessary	a collection of map data representative of, but not limited to, roads, streets, highways, latitude and longitude information, and/or other geographical information.
mobile user station	A mobile device, distinct from a traffic monitor, capable of determining and displaying traffic information	an easily moving or movable device that can transmit data to and/or receive data from the network; it may be a cellular phone or other handheld unit, or may be installed within a car.
said user	Indefinite; alternatively, a person who operates a mobile user station	No construction necessary; alternatively, said mobile user station of claim 1.
traffic information	"Traffic information" should be construed in the context of "traffic information representative of said signals transmitted by said traffic monitors;" if considered separately, the term is indefinite, alternatively it is the current speed, frequency or flow of multiple vehicles traveling along a road as detected by one or more traffic monitors	"traffic information" means data regarding traffic conditions, which data can include, but is not limited to, the speed, velocity, motion, density, flow, frequency of vehicles on a road, and/or other data representative of the movement of vehicles on a road.
traffic information representative of said signals transmitted by said traffic monitors	Indefinite; alternatively, the current speed, frequency, or flow of multiple vehicles traveling along a road as detected by one or more traffic monitors	No construction necessary; alternatively, "traffic information," as previously defined
traffic information database	The term should be construed as part of the larger phrase "traffic information database containing data representative of traffic" and consistent with Google's definition of "data representative of traffic."	a collection of traffic information.
traffic monitors	A stationary device capable of determining the current speed, frequency, or flow of multiple vehicles traveling along a road	any device used to sense, measure, detect, and/or determine vehicular movement and transmit and/or provide a signal representative of vehicular movement.
vehicular movement	The current speed, frequency, or flow of multiple vehicles traveling along a road as detected by one or more traffic monitors	the velocity, speed, position, and/or change in position of a vehicle.
