

Exhibit B

Infringement of United States Patent number 6,826,744 by LG's Android-Powered Smartphones

Claim 1.

A method for generating a computer application on a host system in an arbitrary object framework that separates a content of said computer application, a form of said computer application and a functionality of said computer application, said method comprising:

creating arbitrary objects with corresponding arbitrary names of various object types for generating said content of said computer application, said form of said computer application, and said functionality of said computer application;

managing said arbitrary objects in an object library;

and deploying said arbitrary objects from said object library into a design framework to create said computer application.

Android's objects are arbitrary objects. We created a sample application using the Android Software Developers' Kit (Android SDK). In the following example:

```
<TextView xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/textview"
    android:layout_width="fill_parent"
    android:layout_height="fill_parent"
    android:text="@string/hello"/>
```

The Arbitrary Object "textview" is being called by its name (android:id="@+id/textview"), and additionally has three parameters.

When compiling and running the application, the compilation completes, and the application runs fine (it prints "Alo mundo,Hello Android!") on the Android device as seen in here:
