BEDROCK COMPUTER TECHS., LLC v. SOFTLAYER TECH. SOLUTIONS, LLC, ET. AL PLAINTIFF'S P.R. 3-6 INFRINGEMENT CONTENTIONS

	Claim Language	Court's Construction	Accused Instrumentalities:
			Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
1.	An information storage and retrieval system, the system comprising:		Bedrock Computer Technologies LLC ("Bedrock") does not express a position at this time as to whether the preamble of this claim limits the claim's scope. Nevertheless, Bedrock identifies below aspects of the Accused Instrumentalities that correspond to the claim preamble.
			When AOL makes, uses, sells, offers to sell or imports (or actively induces or contributes to same) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL makes, uses, sells, offers to sell or imports (or actively induces or contributes to same) a system that is especially adapted for information storage and retrieval.
(a) ¹	a linked list to store and provide access to records stored in a memory of the system, at least some of the records automatically expiring,	 <u>a linked list to store and provide access to records</u> means "a list, capable of containing two or more records, in which each record contains a pointer to the next record or information indicating there is no next record" <u>automatically expiring</u> means "becoming obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time" 	When AOL makes, uses, sells, offers to sell or imports (or actively induces or contributes to same) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL makes, uses, sells, offers to sell or imports (or actively induces or contributes to same) a system that is especially adapted to include a linked list to store and provide access to records stored in a memory of the system, at least some of the records automatically expiring.
		· · · · · · · · · · · · · · · · · · ·	Within Linux kernel version 2.6.18, the data structure rt_hash_table in module /net/ipv4/route.c ² anchors one or more linked list(s) to store and provide access to records stored in a memory of the system, at least some of

¹ While the limitations are not lettered in the actual claims of the patent, Bedrock provides them here for ease of reference.

 $^{^{2}}$ The path names of the cited source code is provided for the defendants' convenience. If any version or customization of Linux kernel version 2.6.18 deviates from the path names that are cited in these charts, such deviations are insignificant because it is the routines, functions, methods, macros, classes, data structures, etc., as embodied on servers and other devices, that infringe.

	Claim Language	Court's Construction	Accused Instrumentalities:
			Computer equipment configured with or utilizing software based on
_			Linux kernel version 2.6.18
			the records automatically expiring. In this way, computer equipment
			configured with or utilizing software based on 2.6.18 includes a linked list
			to store and provide access to records stored in a memory of the system, at
			least some of the records automatically expiring.
			reast some of the records automaticany exprints.
			The following code excerpts from the files /net/ipv4/route.c and
			/include/net/route.h show the C language definition for the data structure
			rt_hash_table and the rtable struct definition used by rt_hash_table:
			static struct rt hash bucket *rt hash table;
			<pre>struct rt_hash_bucket { struct rtable *chain;</pre>
			<pre>};</pre>
			struct rtable
			union
			{
			struct dst_entry dst; struct rtable *rt next;
			} u;
			<pre>struct in_device *idev;</pre>
			unsigned rt_flags;
			ul6 rt_type; ul6 rt_multipath_alg;
			ul6 rt_multipath_alg;
			u32 rt dst; /* Path destination */
			u32 rt_dst; /* Path destination */ u32 rt_src; /* Path source */ int rt_iif;
			int rt_iif;
			/* Info on neighbour */
			u32 rt_gateway;
			/* Cache lookup keys */
			struct flowi fl;
			/* Miscellaneous cached information */
			u32 rt_spec_dst; /* RFC1122 specific destination
			*/

Claim Language	Court's Construction	Accused Instrumentalities:
		Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		Linux Kernel Version 2.0.18 struct inet_peer *peer; /* long-living peer info */
		<pre>}; Source: Linux kernel source code files /net/ipv4/route.c and /include/net/route.h</pre>
		In the above code, an entry in the Linux IPv4 routing cache (rt_hash_table) is a list, capable of containing two or more records, in which each record contains a pointer to the next record or information indicating there is no next record. In particular, a rt_hash_table entry contains a field named "chain" which is a pointer to the first record of the list. Records of the list are C structs of the type "rtable". A record contains a field named u.rt_next which is a pointer to the next record in the list. If there is no next record, then the u.rt_next field contains a null pointer.
		In the Linux IPv4 routing cache, a record of a linked list of the routing cache automatically expires when it becomes obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time. More specifically, Linux IPv4 scores the desirability or need for records in the information storage system based on the following criteria:
		1. The age of the routing cache record
		2. The type of route (such as multicast, broadcast, and local)
		3. If the route has been redirected
		The function rt_score is the function that scores the desirability or need for records in the information storage system:
		<pre>static inline u32 rt_score(struct rtable *rt)</pre>
		{ u32 score = jiffies - rt->u.dst.lastuse;

	Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
			<pre>Linux kernel version 2.0.18 score = ~score & ~(3<<30); if (rt_valuable(rt)) score = (1<<31); if (!rt->fl.iif !(rt->rt_flags & (RTCF_BROADCAST RTCF_MULTICAST RTCF_LOCAL))) score = (1<<30); return score; } staticinline int rt_valuable(struct rtable *rth) { return (rth->rt_flags & (RTCF_REDIRECTED RTCF_NOTIFY)) rth->u.dst.expires; } Source: Linux kernel source code file /net/ipv4/route.c At least some of the records—if not all of the records—automatically expire according to the criteria used by rt_score. The records are stored in memory of the information storage system.</pre>
(b)	a record search means utilizing a search key to access the linked list,	function: "utilizing a search key to access the linked list" structure: "CPU 10 and RAM 11 of FIG. 1 and col. 3 lines 52-56 and portions of the application software, user access software or operating system software, as described at col. 4 lines 22-48, programmed with software instructions as described in Boxes 31-36 and Boxes 39-41 of FIG. 3 and in col. 5 line 53-col. 6 line 4 and col. 6 lines 14-20, and/or programmed with software instructions as described in the pseudocode of Search Table Procedure (cols. 11 and 12) or Alternate Version of Search Table Procedure (cols. 11, 12,	When AOL makes, uses, sells, offers to sell or imports (or actively induces or contributes to same) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL makes, uses, sells, offers to sell or imports (or actively induces or contributes to same) a system that is especially adapted to include a record search means utilizing a search key to access the linked list or its equivalent. (b)	identifying at least some of the automatically expired ones of the records, and	<u>expired</u> means "obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time"	When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method that includes the step of identifying at least some of the
			automatically expired ones of the records. Computer equipment configured

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to identify at least some of the automatically expired ones of the records.
		In the Linux IPv4 routing cache, a record of a linked list of the routing cache automatically expires when it becomes obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time. More specifically, Linux IPv4 scores the desirability or need for records in the information storage system based on the following criteria:
		1. The age of the routing cache record
		2. The type of route (such as multicast, broadcast, and local)
		3. If the route has been redirected
		The function rt_score is the function that scores the desirability or need for records in the information storage system:
		<pre>static inline u32 rt_score(struct rtable *rt) </pre>
		u32 score = jiffies - rt->u.dst.lastuse;
		score = ~score & ~(3<<30);
		<pre>if (rt_valuable(rt))</pre>
		<pre>if (!rt->fl.iif !(rt->rt_flags & (RTCF_BROADCAST RTCF_MULTICAST RTCF_LOCAL))) score = (1<<30);</pre>
		return score;
		' static inline int rt valuable(struct rtable *rth)

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		<pre>{ return (rth->rt_flags & (RTCF_REDIRECTED RTCF_NOTIFY)) rth->u.dst.expires; }</pre>
		Source: Linux kernel source code file /net/ipv4/route.c
		At least some of the records—if not all of the records—automatically expire according to the criteria used by rt_score.
		Code contained within or accessed by the function rt_intern_hash in module /net/ipv4/route.c uses rt_score to practice a method that includes the step of identifying at least some of the automatically expired ones of the records.
		The following code excerpt from the rt_intern_hash function performs the step of identifying at least some of the automatically expired ones of the records:
		<pre>rthp = &rt_hash_table[hash].chain; spin_lock_bh(rt_hash_lock_addr(hash)); while ((rth = *rthp) != NULL) { #ifdef CONFIG_IP_ROUTE_MULTIPATH_CACHED if (!(rth->u.dst.flags & DST_BALANCED) && compare_keys(&rth->fl, &rt->fl)) { #else if (compare_keys(&rth->fl, &rt->fl)) { #endif ****</pre>
		<pre>*rp = rth; return 0; } ****</pre>

	Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on
			Linux kernel version 2.6.18
			<pre>if (!atomic_read(&rth->u.dstrefcnt)) { u32 score = rt_score(rth); if (score <= min_score) { cand = rth; candp = rthp; min_score = score; } chain_length++; rthp = &rth->u.rt_next; } if (cand) { Source: Linux kernel source code file /net/ipv4/route.c </pre>
(a)	remaring at least some of	removing at least some of the automatically avaired	When AOL uses (or induces or contributes to others' use of computer
(c)	removing at least some of the automatically expired records from the linked list when the linked list is accessed.	 removing at least some of the automatically expired records from the linked list means "adjusting the pointer in the linked list to bypass the previously identified expired records" when the linked list is accessed means "both identification and removal of the automatically expired record(s) occurs during the same access of the linked list" 	 When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method that includes the step of removing at least some of the automatically expired records from the linked list when the linked list is accessed. Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to remove at least some of the automatically expired records from the linked list when the linked list is accessed. Specifically, code contained within the function rt_intern_hash in module /net/ipv4/route.c is used to practice a method that includes the step of removing at least some of the automatically expired records from the rt_intern_hash function is an example of removing at least some of the automatically expired records from the records from the linked list when the linked list is accessed.

7.	A method for storing and retrieving information records using a hashing technique to provide access to the records and using an external chaining technique to store the records with same hash address, at least some of the records automatically expiring , the method comprising the steps of:	external chaining means "a technique for resolving hash collisions using a linked list(s)" automatically expiring means "becoming obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time"	Linux kernel version 2.6.18 chain_length++; Source: Linux kernel source code file /net/ipv4/route.c Bedrock contends that that this limitation is literally met by statutory equivalence per 35 U.S.C. § 112 ¶ 6, i.e., the code in the Accused Instrumentality performs the identical function as construed by the Court, in substantially the same way as the construed structure for this term, to achieve substantially the same result achieved by the construed structure for this term. Bedrock does not express a position at this time as to whether the preamble of this claim limits the claim's scope. Nevertheless, Bedrock identifies below aspects of the Accused Instrumentalities that correspond to the claim preamble. When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method for storing and retrieving information records using a hashing technique to provide access to the records and using an external chaining technique to store the records with same hash address, at least some of the records automatically expiring. The Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to store and retrieve information records using a hashing technique to provide access to the records and using an external chaining technique to provide access to the records using a hashing technique to store the records and using an external chaining technique to provide access to the records and using an external chaining technique to store the records and using an external chaining technique to store the records and using an external chaining technique to provide access to the records and using an external chaining technique to
			automatically expire. The Linux IPv4 routing cache use external chaining, a technique for

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		resolving hash collisions using linked lists. In particular, for each unique hash value, the routing cache table, rt_hash_table, contains an entry called a rt_hash_bucket. In turn, a bucket contains an entry named "chain" which is a pointer to the first record of a linked list of routing cache records.
		<pre>static struct rt_hash_bucket *rt_hash_table;</pre>
		<pre>struct rt_hash_bucket { struct rtable *chain; spinlock_t lock; }attribute_((aligned(8)));</pre>
		Source: Linux kernel source code file /net/ipv4/route.c
		In the Linux IPv4 routing cache, a record of a linked list of the routing cache automatically expires when it becomes obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time. More specifically, Linux IPv4 scores the desirability or need for records in the information storage system based on the following criteria:
		1. The age of the routing cache record
		2. The type of route (such as multicast, broadcast, and local)
		3. If the route has been redirected
		The function rt_score is the function that scores the desirability or need for records in the information storage system:
		<pre>static inline u32 rt_score(struct rtable *rt) {</pre>
		score = ~score & ~(3<<30);

Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to access a linked list of records having same hash address. Specifically, data structure rt_hash_table in module /net/ipv4/route.c is used to access a linked list of records having the same hash address. Additionally, code contained within the function rt_intern_hash in module /net/ipv4/route.c is also used to access a linked list of records having the same hash address. In this way, computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 practices a method that includes the step of accessing a linked list of records having the same hash address. In this way, computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 practices a method that includes the step of accessing a linked list of records having same hash address.</pre>

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		The following code excerpts from the files /net/ipv4/route.c and /include/net/route.h show the C language definition for the data structure rt_hash_table and the rtable struct definition used by rt_hash_table:
		<pre>static struct rt_hash_bucket *rt_hash_table; struct rt_hash_bucket { struct rtable *chain; };</pre>
		<pre>struct rtable { union { struct dst_entry dst; struct rtable *rt_next; }</pre>
		<pre>} u; struct in_device *idev; unsigned rt_flags; ul6 rt_type; ul6 rt_multipath_alg;</pre>
		u32 rt_dst; /* Path destination */ u32 rt_src; /* Path source */ int rt_iif; /* Info on neighbour */
		u32 rt_gateway; /* Cache lookup keys */ struct flowi fl; /* Miscellaneous cached information */
		<pre>/ Miscerialious called information / u32 rt_spec_dst; /* RFC1122 specific destination */ struct inet_peer *peer; /* long-living peer info */ }; Source: Linux kernel source code files /net/ipv4/route.c and</pre>
		/include/net/route.h

Claim Lar	nguage Court's Constructi	Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		In the above code, an entry in the Linux IPv4 routing cache (rt_hash_table) is a list, capable of containing two or more records, in which each record contains a pointer to the next record or information indicating there is no next record. In particular, a rt_hash_table entry contains a field named "chain" which is a pointer to the first record of the list. Records of the list are C structs of the type "rtable". A record contains a field named u.rt_next which is a pointer to the next record in the list. If there is no next record, then the u.rt_next field contains a null pointer. Because records are hashed to a hash table address before they are added to the chain of records anchored from that address, all records on a chain will have the same hash address.
		The following code excerpts within route.c performs the step of accessing a linked list of records:
		<pre>unsigned hash = rt_hash_code(daddr,</pre>
		<pre>* or * hash = rt_hash_code(daddr, saddr ^ (dev->ifindex << 5)); return rt_intern_hash(hash, rth, (struct rtable**) &skb->dst); * or * hash = rt hash code(daddr, saddr ^ (fl->iif << 5));</pre>
		<pre>return rt_intern_hash(hash, rth, (struct rtable**)&skb->dst); * or * hash = rt_hash_code(daddr, saddr ^ (fl->iif << 5)); err = rt_intern_hash(hash, rth, &rtres);</pre>
		<pre>* or * hash = rt_hash_code(daddr, saddr ^ (fl.iif << 5)); err = rt_intern_hash(hash, rth, (struct rtable**)&skb->dst); * or *</pre>
		<pre>hash = rt_hash_code(oldflp->fl4_dst,</pre>

	Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
			<pre>* or *</pre>
			rt_intern_hash accesses the linked list:
			<pre>rthp = &rt_hash_table[hash].chain;</pre>
			Source: Linux kernel source code file /net/ipv4/route.c
(b)	identifying at least some of the automatically expired ones of the records,	<u>expired</u> means "obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time"	When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method that includes the step of identifying at least some of the automatically expired ones of the records. Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to identify at least some of the automatically expired ones of the records.
			In the Linux IPv4 routing cache, a record of a linked list of the routing cache automatically expires when it becomes obsolete and therefore no longer needed or desired in the storage system because of some condition, event, or period of time. More specifically, Linux IPv4 scores the desirability or need for records in the information storage system based on the following criteria:
			1. The age of the routing cache record
			2. The type of route (such as multicast, broadcast, and local)

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on
		Linux kernel version 2.6.18
		3. If the route has been redirected
		The function rt_score is the function that scores the desirability or need for records in the information storage system:
		<pre>static inline u32 rt_score(struct rtable *rt) </pre>
		u32 score = jiffies - rt->u.dst.lastuse;
		score = ~score & ~(3<<30);
		<pre>if (rt_valuable(rt))</pre>
		<pre>if (!rt->fl.iif !(rt->rt_flags & (RTCF_BROADCAST RTCF_MULTICAST RTCF_LOCAL))) score = (1<<30);</pre>
		return score; }
		<pre>staticinline int rt_valuable(struct rtable *rth) </pre>
		return (rth->rt_flags & (RTCF_REDIRECTED RTCF_NOTIFY)) rth->u.dst.expires;
		}
		Source: Linux kernel source code file /net/ipv4/route.c
		At least some of the records—if not all of the records—automatically expire according to the criteria used by rt_score.
		Code contained within or accessed by the function rt_intern_hash in module /net/ipv4/route.c uses rt_score to practice a method that includes the step of identifying at least some of the automatically expired ones of the records.

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		The following code excerpt from the rt_intern_hash function performs the step of identifying at least some of the automatically expired ones of the records:
		<pre>rthp = &rt_hash_table[hash].chain; spin_lock_bh(rt_hash_lock_addr(hash)); while ((rth = *rthp) != NULL) { #ifdef CONFIG_IP_ROUTE_MULTIPATH_CACHED</pre>
		<pre>*rp = rth; return 0; } ****</pre>
		<pre>if (!atomic_read(&rth->u.dstrefcnt)) {</pre>
		Source: Linux kernel source code file /net/ipv4/route.c

(c)	removing at least some of the automatically expired records from the linked list when the linked list is accessed, and	removing at least some of the automatically expired records from the linked list means "adjusting the pointer in the linked list to bypass the previously identified expired records" when the linked list is accessed means "both identification and removal of the automatically expired record(s) occurs during the same access of the linked list"	<pre>When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method that includes the step of removing at least some of the automatically expired records from the linked list when the linked list is accessed. Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to remove at least some of the automatically expired records from the linked list when the linked list is accessed.</pre> Specifically, code contained within the function rt_intern_hash in module /net/ipv4/route.c is used to practice a method that includes the step of removing at least some of the automatically expired records from the linked list when the linked list is accessed. The following code excerpt from the rt_intern_hash function is an example of removing at least some of the automatically expired records from the linked list when the linked list is accessed:
L		1	The fine of code canep – cane > art_next, performs the step of adjusting

	Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
			 the pointer in the linked list to bypass the previously identified expired records. Source: Linux kernel source code file /net/ipv4/route.c Both the identification and the removal are performed when the linked list is accessed, as is evidenced by the locking and unlocking of the linked list by rt_intern_hash.
(d)	inserting, retrieving or deleting one of the records from the system following the step of removing.		<pre>When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method that includes the step of inserting, retrieving or deleting one of the records from the system following the step of removing. Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to insert, retrieve or delete one of the records from the system following the step of removing.</pre> Specifically, code contained within the function rt_intern_hash in module /net/ipv4/route.c is used to practice a method that includes the step of inserting one of the records from the system following the step of removing.The following excerpt from the rt_intern_hash function is an example code which practices a method that includes the step of inserting one of the records from the system following the step of removing: <pre>rt->u.rt_next = rt_hash_table[hash].chain;</pre>

	Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
			Source: Linux kernel source code file /net/ipv4/route.c
	{ordering of the steps}	ordering of the steps: The "identifying" step must start before "removal" can begin. However, identification need not be completed before removal can begin. The identification step may overlap with the removal step. The ultimate step of claim 7 must follow or at least partially follow the penultimate step of claim 7.	As shown in the code below, the "identifying" step starts before the "removal" step: if (cand) { /* ip_rt_gc_elasticity used to be average length of chain * length, when exceeded gc becomes really aggressive. * * The second limit is less certain. At the moment it allows * only 2 entries per bucket. We will see. */ if (chain_length > ip_rt_gc_elasticity) { *candp = cand->u.rt_next; rt_free(cand); } Further, the ultimate step of claim 7 follows the penultimate step of claim 7.
8.	The method according to claim 7 further including the step of dynamically determining maximum number of expired ones of the records to remove when the linked list is accessed.	dynamically determining means "making a decision based on factors internal or external to the information storage and retrieval system"	When AOL uses (or induces or contributes to others' use of) computer equipment configured with or utilizing software based on Linux kernel version 2.6.18, AOL practices (or induces or contributes to others' practice of) a method that includes the step of dynamically determining maximum number of expired ones of the records to remove when the linked list is accessed. Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 is especially adapted to dynamically determine maximum number of expired ones of the records to remove when the linked list is accessed. Specifically, code contained within function rt_intern_hash, in module /net/ipv4/route.c, dynamically executes based upon comparison with

Claim Language	Court's Construction	Accused Instrumentalities: Computer equipment configured with or utilizing software based on Linux kernel version 2.6.18
		variable ip_rt_gc_elasticity. In this way, computer equipment configured with or utilizing software based on Linux kernel version 2.6.18 practices a method that includes the step of dynamically determining maximum number of expired ones of the records to remove when the linked list is accessed.
		The following code excerpt from the rt_intern_hash function performs the step of dynamically determining the maximum number of expired ones of the records to remove when the linked list is accessed:
		<pre>if (cand) { /* ip_rt_gc_elasticity used to be average length of chain * length, when exceeded gc becomes really aggressive. * * The second limit is less certain. At the moment it allows * only 2 entries per bucket. We will see. */ if (chain_length > ip_rt_gc_elasticity) { *candp = cand->u.rt_next; rt_free(cand); } }</pre>
		chain_length is a variable that dynamically changes to accurately represent the length of a chain, which is a factor internal to the information storage system:
		<pre>chain_length++;</pre>
		The line of code "if (chain_length > ip_rt_gc_elasticity)" therefore makes a decision based on factors internal or external to the information storage and retrieval system.
