EXHIBIT A

The Parties' Proposed Construction of Each Disputed Claim Term, Phrase, or Clause

CLAIM TERM	PLAINTIFF'S PROPOSED CONSTRUCTION	DEFENDANTS' PROPOSED CONSTRUCTION
channel pool	Plain and ordinary meaning	"The set of orthogonal channels available to a central terminal to use to establish wireless links"
orthogonal channel(s)	Wi-LAN proposes construing "orthogonal channels" (in the plural) and "orthogonal channel" (in the singular) separately, as follows: Orthogonal channels: "A set of channels that cross-correlate to zero with respect to each other" Orthogonal channel: "One of the set of	Orthogonal channel: "A communication channel defined by an orthogonal code"
overlay code	"Orthogonal channels" "Orthogonal codes used to increase the number of orthogonal channels that would otherwise be available"	"A second code applied in series with the orthogonal code"
parameters pertaining to a wireless link within the cell indicative of whether that wireless link is subject to interference from signals generated by said other cells	Plain and ordinary meaning	"Two or more indicators that an individual wireless link is experiencing interference from other cells"

CLAIM TERM	PLAINTIFF'S PROPOSED CONSTRUCTION	DEFENDANTS' PROPOSED CONSTRUCTION
subscriber terminal	"User equipment"	"A fixed-location device"
time division multiplexing (TDM) techniques TDM techniques	"Techniques for allocating an interval of time within a predetermined frame period to a data item, based on one or more characteristics associated with the data item"	"Methods in which a communication channel is shared among multiple wireless links by allowing each to use the channel for a given period of time in a defined, repeated sequence"
Plaintiff's proposed term: a TDM decoder arranged to extract a data item from a predetermined time slot within said orthogonal channel Defendants' proposed term: TDM decoder	Wi-LAN believes that it is improper to construe this term in isolation. Rather, Wi-LAN proposes construing the term "a TDM decoder arranged to extract a data item from a predetermined time slot within said orthogonal channel," as follows: "Hardware or software for extracting a data item from a predetermined time slot within the orthogonal channel"	"A device used to extract information from a communication channel that is shared among multiple wireless links by allocating a given period of time to each such link in a defined, repeated sequence"
Plaintiff's proposed term: a TDM encoder arranged to apply time division multiplexing (TDM) techniques Defendants' proposed term: TDM encoder	Wi-LAN believes that it is improper to construe this term in isolation. Rather, Wi-LAN proposes construing the term "a TDM encoder arranged to apply time division multiplexing (TDM) techniques," as follows: "Hardware or software for applying TDM techniques"	"A device that applies time division multiplexing (TDM) techniques to share a communication channel among multiple wireless links"

CLAIM TERM	PLAINTIFF'S PROPOSED CONSTRUCTION	DEFENDANTS' PROPOSED CONSTRUCTION
time slot	"An interval of time"	"A period of time during which a single wireless link is permitted to use a shared communication channel"
 channelisation means for determining which of the orthogonal channels will be subject to TDM techniques, and for transmitting that information to a plurality of subscriber terminals '326 patent, claim 6 	Function: determining which of the orthogonal channels will be subject to TDM techniques Corresponding Structure: The modem shelf 46, including at least the Demand Assignment Engine 380 described in the '326 patent. (See also Ex. B.) Function: transmitting that information to a plurality of subscriber terminals Corresponding Structure: The modem shelf 46, the power supply 44 and RF Combiner 42. (See, e.g., '326 patent, 7:35-8:51, Fig. 3 & Fig. 3A; see also Ex. B.)	Indefinite under 35 U.S.C. §112
 channelisation means also determines, for those orthogonal channels subject to TDM techniques, how many time slots will be provided within each orthogonal channel '326 patent, claim 7 	Function: determining, for those orthogonal channels subject to TDM techniques, how many time slots will be provided within each orthogonal channel Corresponding Structure: The modem shelf 46, including at least the Demand Assignment Engine 380 described in the '326 patent. (See also Ex. B.)	Indefinite under 35 U.S.C. §112
channelisation means for determining which of the orthogonal channels will be subject to overlay codes, and for	<u>Function</u> : determining which of the orthogonal channels will be subject to	Indefinite under 35 U.S.C. §112
