### What is Xi3?

Xi3® is an exciting, new, patented architecture pioneered by Salt Lake City, Utah based ISYS Technologies, Inc. The concept and goal of the Xi3 Corporation was to redesign the traditional computer to a completely new, universal, energy efficient, cost-effective modular computer design. The design works with existing industry components and software, allowing easy adoption into the IT industry. Xi3 architecture is a universal hardware platform, designed for any solution, from ARM- or X86- based, low-power embedded systems, to home and desktop computers, to affordable servers and supercomputers. The universal, simplified Xi3 design will enable the industry to progress faster and more efficiently than ever before. After nearly a decade of planning, development, and waiting for patents to issue, the first Xi3 product information was released to the public in November 2010. Many other exciting Xi3 products are currently under development and will be released in the years to come.

### What Does Xi3 Stand For?

**X=Variable-** One of the great benefits to the Xi3 approach to computer architecture is its ability to easily configure a computer to meet any specific requirement. In this way, Xi3 technology breaks the mould by separating the traditional motherboard into three distinct boards. The "X" factor of Xi3 is the patented Xi3 Backplane. The Xi3 Backplane card (also referred to as the [I/O Card]) defines and identifies the specific function of the system. By separating the functionality of the system from the "core" (processor and memory), the Xi3 architecture can be easily configured to meet any computing need.

**I=Information-** The world is moving information faster than ever before. The fastest way to move information is through Information Technology. One of the biggest problems facing the Information Technology industry today is the variety and sources of information that need access to processing power. The Xi3 design allows IT engineers and developers the ability to focus their efforts on their specific requirements. The result is faster development times at a reduced cost.

**3=Cubed-** Since the invention of the computer, traditional computer designs have been stuck in a 2-Dimensional world. Xi3's forward thinking design uses the power of geometry to unlock a smaller, more compact design than traditional computer systems. After much research and development, the cube was determined to be the most effective design for a universal computing platform.

Using this patented approach, Xi3 provides the building blocks for the future of custom computer development and design, enabling people and companies to do more with technology for less.

There is a better way! Welcome to the Xi3 Revolution!

**Key Advantages to Xi3™**

Xi3™ is adaptable for all types of computing.

Our central goal at Xi3 Corporation is to replace today's single-purpose computing technologies with a multi-purpose architecture called Xi3. Xi3 is an advanced, standardized core-processing technology that provides four key advantages:

**1. Advanced feature sets:**

Xi3 is a new architectural standard, one complete with advanced backplane designs and superior cooling processes. By coupling these advances to a standard architecture, Xi3 provides manufacturers with the ability to introduce more advanced feature sets into a diverse field of products.

**2. Greater versatility:**

The patented Xi3 architecture developed by ISYS Technologies, Inc. and licensed to Xi3 Corporation removes the peripherals from the substrate and makes logic interchangeable and adjustable, thus allowing a computer's application to be varied or manipulated at will.

**3. True scalability:**

Xi3 is the new standard for scalability – a core processing architecture that allows multiple processing units to be added or subtracted as dictated by application or user demands. Added units work together with the original processor to increase functionality exponentially (more units equal more power). These units are coupled together in a network-like environment and allow additional processing capability to be added to the processing core or subsystems to satisfy new processing requirements. The ability to strip out the same units to create additional work stations provides the elusive flexibility paramount to a successful infrastructure.

**4. Cost savings:**

The Xi3 architecture allows one computing design to be used in virtually any computing application. This reduces the variety and amount of raw materials and manufacturing processes unique to each individual application, translating into dramatic cost savings.

Xi3 architecture is superior to the computer architecture used today. This new approach to computer development will revolutionize the way personal and commercial computers will perform. It will also change how computers are integrated into everyday products such as cars, planes, appliances, and home fixtures. It will further change the way people use computers at home and work, how they connect to the Internet, and how they interact with consumer and household products of all kinds.
